CAD/CAM dentistry and the laboratory technician: Partners in success

By Lee Culp, USA

The concept of digital dentistry is one that started out small and has progressively increased in momentum until its boundaries appear to have become endless. New technologies in dentistry will only be successful if they are combined with a complete understanding of basic comprehensive dentistry.

Leading dental companies form KaVo Kerr Group

By Dental Tribune International

Chicago & Washington, USA: Yesterday, Henk van Duijnhoven, senior vice president of Danaher Corp., a U.S. umbrella corporation encompassing brands from various industries, announced the formation of KaVo Kerr Group. The group strategically unites leading dental consumable, equipment, high-tech and specialty brands under one platform.

The formation of KaVo Kerr Group enables us to better serve dental professionals and healthcare providers who purchase equipment, high-tech and specialty brands under one platform.

Handing over ceremony

By International College of Dentists

This was a historic moment for Section X with the handing over of the presidency taking place for the first time outside Lebanon. The meeting took place in Dubai at the Fairmont Hotel on February 4th in the presence of fellows from both districts and guests. The event was sponsored by CARE and Planning.

Brilliant technology for diagnostics: KaVo DIAGNOcam: A new look at caries

By KA VO

With the introduction of the caries diagnosis device DIAGNOMent 15 years ago and more than 60,000 devices sold, KaVo has set a new standard in caries detection. We are now combining this great success with the new DIAGNOcam and is thereby setting new standards in caries diagnostics. The new KaVo DIAGNOcam is the first camera system that uses the tooth’s structure to verify caries diagnosis. To do this, the tooth is transilluminated utilizing light of a specific wavelength and used like a light conductor. A digital video camera records the image and displays it live on a computer screen. Carious lesions are displayed as dark shadows. The images recorded by the KaVo DIAGNOcam can be stored, thus significantly simplifying monitoring and patient communication.

With its DIFOTI technology (Digital Imaging Fiberoptic Transillumination), DIAGNOcam offers high diagnostic safety which is comparable or superior to X-ray diagnosis in many cases, in particular with regard to approximal and occlusal caries. Furthermore, it is possible to show certain kinds of secondary caries and cracks. The X-ray free device thereby allows early and very gentle caries detection. Compared to other methods, the clinical significance is not distorted through plaque deposits.

Because of its easy handling, the device can quickly be integrated in existing routines, thereby resulting in a distinct added value in terms of patient motivation and information. Experience the next generation of caries detection with the KaVo DIAGNOcam.
Elegant design and easy handling are a winning combination.

CEREC OMNICAM

THE EVOLUTION OF SIMPLICITY

The new CEREC Omnicam combines powder-free ease of handling and natural color reproduction to provide an inspiring treatment experience. Discover the new simplicity of digital dentistry – exemplified by Sirona’s premium camera portfolio: CEREC Omnicam and CEREC Bluecam. Enjoy every day. With Sirona.

Saliva and Oral Health

By Michael Edgar, Colin Dawes & Denis O’Mullane and contributed to by C. Dawes

Excerpt from Saliva and Oral Health - An Essential Overview for the Healthcare Professional, 2012

T he presence of saliva is vital to the maintenance of healthy hard (teeth) and soft (mucosa) oral tissues. Severe reduction of salivary output not only results in a rapid deterioration of oral health but also has a detrimental impact on the quality of life for the sufferer.

An understanding of saliva and its role in oral health helps to promote awareness among oral health care professionals of the problems arising when the quantity or quality of saliva is decreased; this awareness and understanding is important to the prevention, early diagnosis and treatment of the condition. There is an extensive body of research on saliva as a diagnostic fluid. It has been used to indicate an individual’s susceptibility to developing caries; it has also been used to reflect systemic physiological and pathological changes which are mirrored in saliva. One of the major benefits of saliva as a diagnostic fluid is that it is easily available for non-invasive collection and analysis. It can be used to monitor the presence and levels of hormones, drugs, antibodies, microorganisms and ions.

Factors Influencing Salivary Flow Rate and Composition

The following article provides an overview of the differences in flow rate and composition between unstimulated saliva (secreted continuously in the absence of exogenous stimulation) and stimulated saliva (secreted usually in response to masticatory or gustatory stimulation), the factors influencing salivary flow rate and composition, and their physiological importance.

Unstimulated saliva

Unstimulated whole saliva is the mixture of secretions found in the mouth in the absence of exogenous stimuli such as tannants or chewing. It is composed of secretions from the parotid, submandibular, sublingual, and minor mucous glands but it also contains gingival crevicular fluid, desquamated epithelial cells, bacteria, leucocytes (mainly from the gingival crevice), and possibly food residues, blood, and viruses.

Several large studies of unstimulated salivary flow rates in healthy individuals have found the average value for whole saliva to be about 0.3-0.4 ml/minute, but the normal range is very large and includes individuals with very low flow rates who do not complain of a dry mouth. Such a broad normal range makes it difficult to say whether or not a particular individual has an abnormally low flow rate. Unless saliva is almost completely absent, patients can be said to have a dry mouth (xerostomia) only on the basis of their subjective symptoms. However, a flow rate of <0.1 ml/min is considered objective evidence of hyposalivation.

Whether the flow rate is high or low is much less important than whether it has changed adversely in a particular individual. Physicians will often take a patient’s blood pressure as a yardstick for future measurements. Dentists, however, do not routinely measure the salivary flow rate, so that when a patient complains of having a dry mouth, it is impossible to judge whether or not a genuine reduction in flow has taken place. It would therefore be very advantageous if dentists included measurement of salivary flow as part of their regular examination.

Just as there are individuals with very little saliva but without discomfort, so there are others with flow rates within the normal range who feel that their mouth is drowning in saliva. This problem is often due to difficulty in swallowing, rather than to a genuinely high flow rate.

Factors affecting the unstimulated salivary flow rate

• Degree of hydration – This is potentially the most important factor. When body water content is reduced by 8%, the salivary flow rate decreases to virtually zero.

• Body posture – Flow rate varies with position and a person when standing or lying will have a higher or lower flow rate, respectively, than when seated.
Recent study shows that females have lower salivary flow rates than males and a greater number of women may be at risk of dental caries.

Most studies have found that factors affecting salivary flow rates have been leached out. (5) Factors affecting salivary flow rate include gender, gland size and unilateral stimulation.

Factors affecting the stimulated salivary flow rate

• Chewing gum – Research shows the flow rate is high initially but after about ten minutes, as the flavour and sweeteners leach out and only the gum-base remains, it falls to the rate obtained by chewing gum-base alone, namely to two to three times the unstimulated rate. This increase in salivary flow during gum chewing can be maintained for as long as two hours and this may be very beneficial to those with a dry mouth. Even after two hours of gum chewing, the salivary glands do not become ‘exhausted’ and introduction of a fresh piece of gum causes a secretory response similar to that initially.

• Mechanical stimuli – The action of chewing, in the absence of any taste, will itself stimulate salivation but to a lesser degree than maximum gustatory stimulation with citric acid.

• Gender, gland size and unilateral stimulation

Most studies have found that females have lower salivary flow rates than males and a recent study showed that in females, the sizes of the major salivary glands are smaller than in males. Additionally, if one habitually chews on one side of the mouth (for instance with chewing gum), most of the saliva will be produced by the glands on that side after the initial tannins in the gum have been leached out.

Salivary flow rate and oral health

The unstimulated flow rate is more important than the stimulated flow for oral comfort, since only a small fraction of the saliva is spent eating. However, stimulation of the glands through mastication is beneficial in terms of promoting clearance of food from the mouth and may help by causing an increase in the unstimulated flow rate, although further studies of this are needed. A study has shown that two sugar-free chewing gums, one containing chlorhexidine, by a group of ‘frail’, elderly, dentate subjects over a one-year period, led to improved oral health and a statistically significant 55-100% increase in their stimulated salivary flow rate. (5) This suggests that if the glands are stimulated regularly, their secretory ability may increase. Unfortunately, unstimulated flow rates were not measured in that study.

Carbohydrate clearance from the oral cavity

One major role of saliva is the clearance of carbohydrate from the mouth. The more rapid the flow, the faster the carbohydrate is cleared. This is true whether the saliva is unstimulated or stimulated, for example by chewing gum. If the gum contains sweeteners such as xylitol or sorbitol, which are minimally metabolised by plaque bacteria, then the increased salivary flow will be very effective in clearance of cariogenic carbohydrates remaining from previously consumed food.

The composition of saliva

The composition of saliva is affected by many factors, such as the type of salivary gland producing the saliva. For example, most of the amylase in saliva is produced by the parotid glands while blood-group substances are derived mainly from the minor mucus glands.

Factors affecting salivary composition

• Flow rate – The main factor affecting the composition of saliva is the flow rate. As the flow rate increases, the pH and concentrations of some constituents rise (e.g. protein, sodium, chloride, bicarbonate), while those of others fall (e.g. magnesium and phosphate).

• Duration of stimulation – When the salivary flow rate is held constant, the composition of the saliva depends on the duration of stimulation.

Clinical and diagnostic advantages of PreXion 3-D imaging system

By Dan McEowen, DDS

F or nearly 100 years, dentists have relied on 2-D radiographic imaging for diagnosis and treatment planning. With the 1999 introduction of cone-beam computed tomography (CBCT), all dentists now have tools available for more accurate diagnosis and treatment.1

The ability to look at a tooth in any direction and orientation, as well as in 3-D, eliminates much of the guesswork commonly experienced with 2-D radiographs.

We have been limited in most cases to only a buccal-lingual view provided by periapicals, bitewings and panoramic radiographs with the occasional axial view of an occlusal film. Medical CT scans and images began in the early 1970s and were sometimes used by dentists during our first multiplaner views.2

The adoption of 3-D cone-beam imaging is appropriate and has important advantages for all modalities of dentistry. From every specialist to the general dentist, the increased amount of radiographic information as well as increased accuracy will aid in the most sound diagnostic possibilities.

CBCT description

CBCT is a single or partial rotation of an X-ray source around the head, capturing X-rays on various flat panel arrays and sensors. The information is converted to a series of axial slices by computer tomography and stored as virtual anatomy in the computer. With the use of sophisticated software, the dentist is able to view information in several different views, including: axial slices (head-to-toe orientation), coronal slices (front-to-back orientation), sagittal slices (side-to-side orientation) all known as multiplanar reconstructions (MPR). The thickness of each slice can be varied to include more or less information. Because the voxels (volumetric pixels 3-D) are isotropic, other MR images can be generated by slices drawn at an angle curve of thickness through the scan to view areas critical to the final diagnosis.3

The final view offered by CBCT is a 3-D view that can be rotated and viewed in any direction. Once again through software manipulation, 3-D images can be viewed as conventional radiographs, maximum intensity projections (MIP), soft-tissue projections and a variety other views.

This nearly endless ability to manipulate the data aids in the diagnosis and identification of disease, nerve canals, sinus morphology, dental caries, bone density, fractures, endodontic pathology, implant placement criteria, periodontal defects, bone pathology, fractured teeth, iatrogenic trauma, TMJ morphology and disease, third-molar position and many more healthy or diseased conditions.

Early CBCT adoption with implants

The first and primary use of CBCT for early adopters was implant placement. As the scope and the value of the information became better known, dentists of all branches began to see the value of MPRs and 3-D renderings including periodontics, endodontics, oral surgery, treatment of TMJ, orthodontics, implantology and general dentistry.4,5

Clinical periradical and panoramic radiographs for the placement of implants can be misleading with elongation, foreshortening, superimposition and geometrically incorrect data.6 A look at a failed implant in the periapical shows no obvious disease to an existing integrated implant. Clinically, a buccal fistula was present with exudate and slight pain. The CBCT scan (Fig. 1) reveals a more accurate view showing a buccal defect on a sagittal MPR. A surgical flap revealed a dehiscence of the coating of the implant. Removal of the foreign body resulted in an asymptomatic and healthy patient.

The evaluation of the available bone for the initial implant placement can be crucial for the long-term success of the case. If there is inadequate bone available, grafting may be a necessity. CBCT studies render the most accurate information available at a low radiation dose. The periapical shows an obvious lack of bone height, but does not show the buccal pathology or an accurate view of the sinus morphology (Fig. 2).

The MPR view of the CBCT shows all necessary measurements to perform the sinus lift and grafting with the immediate placement of the implant fixture (Fig. 3). Three-dimensional views show the floor of the sinus and any soft-tissue pathology.5-6 Having accurate measurements in all dimensions is an advantage of CBCT scanning.

CBCT and endodontics

Endodontics is a field that is rapidly adopting the use of CBCT and for good reason. The inherent geometric deficiencies of 2-D radiographs make the CBCT scan a valuable adjunct to investigate the root morphology in both 2-D and MPR. The typical periapical will show superimposed canals in the anterior or bicuspids and molars as well as unwanted bone densities both buccal and lingual to the affected tooth making the image quality poor.

The ability to view MPR slices in cross-section, long axis and oblique directions gives the ability to follow all canals in any direction and show their relationship and measurements of the root. This virtual tour of the root morphology is a great benefit in the final treatment outcome.5,6

Post root-canal infection can be difficult to diagnose with the standard periapical. The endodontic fills may appear to be normal even though other clinical findings and symptoms are abnormal. The patient presents several months post root-canal treatment with pain on palpation and pressure and avoids this side of the mouth.

A periapical radiograph shows minimal pathology (Fig. 6). The roots appear to be filled and a small puff of sealer extends through the apex of the mesial roots. The distal root structure and fill appear normal. There is little indication of periapical radiolucency or an obvious opening of the periodontal ligaments of the mesial roots.

A CBCT scan reveals a completely different picture. The coronal MPR reveals a short fill near the apex of the mesial root lingual and a large radiolucency (Figs. 7, 8) not visible on the periapical radiograph (Fig. 6).

Missed canals are difficult to see in a buccal-lingual projection of the periapical radiograph as one canal is superimposed on the other (Fig. 9). Often, as viewed in this radiograph, we see periodontal pathology with an apparent normal filling of the canal. CBCT scans allow dentists to look for pathology in MPR planes to identify the actual problem before invasive procedures are performed on the patient. The axial view shows a lingual canal exists and is untreated. The coronal view confirms the diagnosis and treatment can be completed (Fig. 10).

Today’s endodontists, as well as general dentists, are benefiting from the diagnostic capabilities of the high-resolution CBCT scanners available over conventional 2-D perapiicals.8

Oral surgery

Oral surgery, with its inherent invasive nature, can be better served using CBCT with MPR as well as 5-D images. The ability to perform virtual surgery is a benefit to both the doctor and the patient. Doctors have the advantage of seeing morphology and landmarks in real time and space with accurate measurements, using CBCT will gain a better understanding of the problems and the solutions their doctors are offering them.

Third-molar extractions can be risky based on 2-D and panoramic radiographs.

HAAD as having educational content for 2 CME Credit Hours

DHA awarded this program for 2 CPD Credit Points

CAPP designates this activity for 2 CE credits.
These radiographs can often superimpose nerves and sinuses over root structures. Dentists using 2-D radiographs must often rely on experience to assess the risks of iatrogenic trauma. The use of CBCT with MRPs and 3-D images reduces any guessing as well as the chance for any permanent damage to the patient. With the adoption of CBCT, the judgment is based on solid evidence and the risk will decrease. A panorex of the superimposed third molars gave no solid evidence the canal lies between the roots. It is only with the use of CBCT and the MRPs that the nerve can accurately be seen traversing between the mesial buccal and mesial lingual root (Fig. 11). Other surgical advantages include the ability to understand the position of supernumerary or impacted teeth. The MPRs and the 3-D projections give the clinician a complete picture of the problems and the treatment course.

Orthodontics

Orthodontists are beginning to adopt large field-of-view CBCT. Recent studies show that linear measurements of bony structures are more accurate using CBCT and have less distortion than currently used methods of measurement: lateral cephalometric, posterior-anterior (PA) and submental view (SMVT). Accurate measurements of tooth volume and tooth position can aid in accelerated treatment times and more precise treatment.

Along with tooth position, density of bone and size of arches, the orthodontist also has an accurate evaluation of the temporomandibular joint and position of the condyles. Impacted teeth are easily identified and position either buccal or lingual can be confirmed prior to movement or removal. Both MRPs and 3-D projections give the clinician complete information from CBCT scans.

About the author

Dan McEowen, DDS, is a 1982 graduate of Loma Linda School of Dentistry and has been in private practice for 26 years. He is a founding member of the World Clinical Laser Institute, achieving a mastership level of proficiency. He has been active in FDA approval of oral surgery techniques using Erbium lasers. McEowen has lectured and trained internationally in techniques using lasers in general and specialty dental fields. He is a member of the ROI and is active in implantology. McEowen has been involved in cone-beam technology for more than five years and owns 3D Imaging Center in Maryland.
Clinical digital photography. Part 1: Equipment and basic documentation

By Dr. Eduardo Mahn, DDS, DMD, PhD
Universidad de los Andes
Clínica CIPD Santiago, Chile

Abstract: The use of photography is becoming a standard in modern dental practice. The sharing of pictures is not only essential for communication between dentist, laboratory technician and patient, but also for communication between professionals, undergraduate and postgraduate students with their teachers and for documenting of clinical procedures in cases you want to show to both patients and work colleagues at scientific meetings. This article will describe the necessary equipment for clinical photography, explain its uses and deliver the foundation for basic documentation and structure for clinical cases. The second part will discuss the step-by-step documentation and show practical examples to improve your results.

Introduction
The first process of photography was presented to the world by Louis J. M. Daguerre at the Paris Academy of Sciences on January 7, 1839. In that same year, Alexander S. Wolcott, a manufacturer of dental instruments, designed and patented the first camera producing images on a silver-coated copper plate. Thanks to the graphic documentation that this allowed, it created the first dental journal, the American Journal of Dental Science.

Due to the advancement in technology, we now have the privilege of having digital photography that allows an immediate view of the results and not having to wait for the processing of films as was the case of old movies, utilizing silver halide ions in a gelatin emulsion on a strip of celluloid film to capture latent images. The advantage of digital images is that in addition to instantly seeing them through a viewfinder, there is less cost of developing film negatives and their storage is easy and fast. The power of viewing and saving images in computers also saves space and access to a database is almost immediate. By developing different virtual media files and almost universal use of email, information sharing is almost instantaneous anywhere in the world.

Because many of the procedures performed in dentistry represent established protocols that should be read, learned and then practiced, it becomes clear that photography aids us in teaching or explaining to our patients what we think are common, but to them are complex and mysterious procedures.

Digital Cameras

There are currently hundreds of cameras on the market. If we compare their features and capabilities, we can divide them into 5 groups:

Compact cameras (point and shoot), interchangeable lens cameras (mirrorless system cameras) and reflex cameras, SLRs DSLR (Digital Single Lens Reflex).

Initially, compact cameras (Figure 2) seem appealing, but they have many limitations. They do not have a consistent image control, the position of the flash is not suitable for intraoral photography, distorted images from utilization of an insufficient macro lens in the wide-angle position, lack of manual exposure and focus problems. One of the biggest problems is the inability to change the lens, which given its

Figure 17: Examples of a portrait with distorting light (Figure 14) or ring flash (Figure 5), it is most suitable for intraroral photography, and has been a quite discussed topic for many years.

The ring flash light is the favorite amongst inexperienced dental photographers and it is considered the universal flash system for general macro photography. The second group seems promising, but is still in development, and the third group, DSLR cameras (Figure 5), are those with greater advantages for clinical use, thanks to the sensor size and the many options in manual mode, lenses and flashes.

These cameras use a lens for both image composition and image capture. This design, which allows direct viewing and focusing without parallax error, is ideal for dental photography. One of the biggest advantages is the ability to exchange lenses. For example, you can take pictures of landscapes, portraits, and all dental treatments with the same camera, by just changing the lens. The same applies with changing the flash. All professional cameras more than meet the requirements. One advantage is that the professional cameras are more than the require-

Figure 14 and 15: Photo without and with a contrastor. Notice how the desired clinician wishes display.

Figure 16 and 17: Examples of a portrait with distorting light (Figure 14) or ring flash (Figure 5), it is most suitable for intraroral photography, and has been a quite discussed topic for many years.

The ring flash light is the favorite amongst inexperienced dental photographers and it is considered the universal flash system for general macro photography. On the one hand, it is true that the greater the distance between the ring flash and the subject, the flatter, less texturized and refined the photos are, while a twin flash generates pictures with more texture, contrast and that look more alive.

The macro lateral flash shows more variability in light direction, allowing certain details to be highlighted. The overall hue of color, cracks and also transitions are best captured with the macro lateral flash. Probably the only drawback, besides its higher cost, is when photographing posterior regions, where access and space is limited. In these cases, the homogeneous light and easy handling of the ring flash has an advantage. In the author’s experience, when a clinician decides to begin clinical photography, a ring flash is more

> Page 9
than adequate; the extra cost of the macro lateral flash is not justifiable, since differences in the early stages of the learning curve will not be substantial. Then once they handle certain techniques, the macro lateral flash is a great contribution.

Lenses

Basically, macro lenses from 50 to 200mm in focal length are used for clinical photography. In the author’s experience, macro lenses of about 100 mm in focal length provide the ideal combination of magnification ability and convenience working distance for dental purposes. Teleconverters or zoom lenses can be used, but not recommended. The same goes for lenses with autofocus mode. If this is the case, the automatic mode must be switched off and put on manual. Focusing is done manually and moving the ring less near a sharp image, and with small movements to and fro, achieves perfect focus. A high quality lens is paramount to capturing crisp and bright photos. This aspect should not be compromised. It is ideal to have a magnification ratio of 1:1. In the author’s experience a good lens to start off with at a reasonable cost is the Sigma 105mm f/2.8 EX DG macro (Figure 6), which is compatible with different brands of cameras. On the other hand, for the seasoned and professional photographer, who does not want to compromise quality, a Nikkor macro lens and the AF-S 105mm f/2.8 ED, VR (Figure 7), would be recommended, though costing more than double compared with the aforementioned Sigma.

Black background or contrastors

To gain better access to the buccal cavity, better visualization of the structures of interest and that they are sufficiently illuminated, it is essential to have good lip retractors. They should neither be very uncomfortable for patients, should avoid reflexions and ideally possess a certain capacity to stay in place and avoid having the dental assistant hold them, as is the case with Mirahold type retractors (Figure 8). In the case of a Span-dex type (Figure 9) or soft latex retractors from buccal Vivadent OptraGlate (Figure 10), this does not happen and the picture can be taken without external help. Ideally, always choose the larg-est possible retractor for improved exposure of the struc-tures of interest. The clinician can make the process less cum-bersome by using petroleum jelly or cream on the patient’s lips before starting.

Mirrors

When taking pictures in posterior regions, mirrors are invaluable, since the angle of the buccal area doesn’t allow taking of direct photos. To avoid double images and to enhance the sharpness, quality mirrors are needed, ideally houndum. It is useful to have mirrors with long firm handles (Figures 11-15), in order to position your hands away from the objects of inter-est and avoid unwanted shad-ows. This is of particular im-portance in documenting steps when showing the use of mate-rials or objects near to the teeth. To prevent the mirror missing up, they must be at a tempera-ture similar to that of the oral cavity. For this effect you can use hot water or any type of air heater. You should also ask the patient to breathe through their nose. Another option is that the dental assistant gives a neutral beam of light through the triple syringe. It is noteworthy that these mirrors are very sensitive with Mirachrome, black shad-owless, and with ratchets, even with a centripetal layering tech-nique. The choice of a type of black plastic can also be used as long as they do not gen-erate unwanted reflections. If you do use material other than contrastors, it is important to use your preference consistent-ly when photographing a series of photos. If you decide to cut the edges of the picture by us-ing software such as Photoshop, it not only will not produce the same results, because cropping will increase the relative size of the pixels due to the magnifi-cation of the desired area, but will increase the time invested by the clinician producing good quality clinical photos.

Examples

In order to compliment intra-oral photography, it is recom-mended to show pictures of patients before and after treat-ment. These types of photos, although may seem simple and easy to execute, can present difficulties. In Figure 16 and 17, you can see a badly taken picture, distracted by multiple flaws such as inadequate back-ground, shadowing on the right side, and an unfavourable facial expression, etc. In contrast, Fig-ure 16 shows a clearer picture, a neutral background, no un-wanted shadows, good lighting and a positive expression. In this case, the patient is at ease and the mirror produces an image best achieved where the picture is centered, well lit, and without the presence of other disturbing structures.

Case report

One of the main objectives of the documentation process, is to express to patients or students what steps were performed to reach certain results. It is also beneficial to graphi-cally present and compare new and already established tech-niques. The following is simple a case of two composite reconstruc-tions with sectional matrices and a centripetal layering tech-nique. On an exa-mple of the de-tailed documentation and standardization that images should demonstrate.

Another objective of a system-atic and thorough documentation is to have graphic material, either for patients to understand or for treatment results objectively, so they have no ob-scured treatment expectations. These types of aesthetically documented treatments will be discussed and presented with documented cases in a step by step manner in the next chapter of this series, in addition to discussing common mistakes and how to solve them.

Using Cone Beam (CBCT) in Implantology

By Dr Alexander Luke

Abstract: Cone beam computed tomography (CBCT) is a diagnostic imaging technology that has changed the way in which dental practitioners view the oral and maxillofacial region, teeth and the surrounding structures. CBCT is designed in such a way that 3D images are seen without distortion and superimposition which is similar to CT imaging. The advantages of CBCT are: simpler image acquisition, lower capital cost and less radiation dose to the patient.

Introduction

Radiographic examination is an important diagnostic tool in dental implants treatment planning. Information obtained from a conventional or a digital radiography is limited by the fact that the 3D anatomy of the area being imaged is compressed to a 2D image. The superimposition of structures is again a major limitation of the 2D image. Cone Beam Computed Tomography (CBCT / CBVT) is a 3D x-ray imaging technology that exposes the patient to an x-ray beam in the form of a cone which is revolved around the patient. The benefit that this has over a CT scan is that a CBCT scan requires significantly reduced exposure times and so exposes the patient to significantly less x-ray radiation. However compared to a 2D x-ray there is still an increase in dose and so consideration is still required when recommending a 3D view. The European association of osseointegration (EAO) have given guidelines which states that cross sectional imaging is beneficial in preoperative assessment and treatment planning of dental implants and that should not be a regular protocol post operatively unless needed.

A CBCT scan captures multiple images (ranging from 150 to more than 600) in a single scan with fewer artifacts when compared to panoramic radiography. 3D Images are ideal for planning the placement of implants. As with all x-ray procedures CBCT carries a radiation exposure risk to the patient and so it is necessary to ensure that the dose is kept to a minimum and will provide optimum diagnostic information resulting in improved patient care.

CBCT collimates the x-ray beam to focus on the area of interest known as the field of view (FOV). It is advisable not to radiate outside of the area of interest so it is very important that the CBCT system offers a choice of FOVs ranging from small to medium to large allowing the user to select the optimum FOV for the treatment. This function may not be available in all CBCT units however it is essential so that the user can select the correct FOV for the treatment and more important has available a small Field of View (for example 5.5 x 5cm) which is in fact suitable for...
the majority of dental examinations. At this level the effective dose is small enough to increases those examinations that can be justified to have a CBCT scan.

CBCT images are isotropic with ranges from as low as 0.076 mm to 0.4 mm. The images in different planes and the multiplanar reformatted images had led to achieve the level of spatial resolution accurate in measurements such as in implants site assessment.

**Indications for CBCT in implants**
1. To assess the quantity and quality of the bone in the edentulous area.
2. The relationship of the implants to the neighbouring areas.
3. For the placement of implants in the desired area.
4. In designing a surgical guidance template.

**Limitations of CBCT in implant planning**
Crowns or metallic appliances in the mouth can cause artifacts of the 3D image. The metals causing artifacts can range from minimum to the extent that the image interpretation is difficult.

**Conclusion**
2D imaging has been serving the dental fraternity in their diagnosis and will continue to do in the future. The recent availability of 3D imaging using CBCT systems for treatment diagnosis and planning implant positioning gives the dentist more accurate information and improved patient care.

The Carestream CS 9000 3D has a FOV of 5 x 3.7 cm creating images with a resolution of 0.076mm. This resolution is beneficial for accurately planning implants and overall improved treatment.

**Improving the standard of care for every dentist**

**CS 9000 3D:** Appreciated already by dentists all over the world, the essential CS 9000 3D imaging system enhances the standard of care in the general practice. It enables you to do more, see more and offer more – all in your practice and at an affordable price.

- 3D, panoramic and optimal cephalometric imaging
- High resolution imaging (76 µm) at a very low dose
-Focused fields of view from all angles and slices
- CAD/CAM ready for enhanced capabilities and procedures

Interview: Vanik Kaufmann explains the advantages of KaVo’s new ARCTICA CAD/CAM system

Not only has the proprietor of the dental laboratory CeraTech in Liestal near Basel been a CAD/CAM user from the very beginning but he also has provided valuable input into the technology’s development through his active participation in it. Recently he has become the owner of KaVo’s new ARCTICA system. We wanted get his first impressions from working with the system.

KaVo’s Mr. Kaufmann, you recently started using KaVo’s ARCTICA CAD/CAM system. You have extensive experience with CAD/CAM systems. What do you consider to be ARCTICA’s particular advantages? Mr. Vanik Kaufmann. First of all there is the striped light scanner. I particularly like that it is a semi-automatic design. With fully automated systems I often encounter problems with cumbersome re-scans when the first scan was incomplete. Scans that require essentially no corrective work can be achieved with very little experience. In addition, it works extremely fast. And even in cases where the scan shows gaps the model can be repositioned accordingly, perhaps by tilting, and the software applies any subsequent corrections automatically.

And what are your experiences with the grinding unit? I really appreciate that it is a compact 5-axis system that not only uses blanks very economically but also that I am finally able to process metal, something that up until now was not possible with small systems.

Is zirconium dioxide still important nowadays? There are still dentists who request metal frameworks. When CrCo alloys are required, we have then externally made by selective laser sintering. When biocompatibility is required, it has to be titanium. We process a large number of titanium connecting bar and up until now had to have them fabricated externally.

Now we are able to do this in house and the design is simple and fast by means of the software provided.

How practical is the software? It is fantastically simple. E.g., during the design of an anterior bridge, the automatically proposed crown can be moved and rotated through key combinations which are considerably faster and simpler than with other solutions that require multiple key clicks. And its operation is intuitive to learn. Within half an hour of receiving it I was able to do a bar design without a hitch and without receiving any training. KaVo’s hotline with remote support is equally fantastic and useful especially in the early stages when one might have the occasional problem: These consultants are highly competent, they can log in remotely and point out mistakes on your own screen or give hints on how to do things even faster.

The multiCAD Software is equipped with open interfaces, but not every scanner supplier offers open interfaces. How much data transfer can you utilise? We are not only able to do this with manufacturers that provide STL files but also with others who still believe in the advantages of proprietary systems. We are using Rhino’s dental shaper for this purpose; it can convert all relevant data sets to compatible STL files. You also use a printer (SolidScope). Are you using ARCTICA data in third-party materials? Yes. We have decided to no longer use ARCTICA data with screwed locators fabricated in the Arctica Engine.

Could you share your experience with the implant module? We fabricate connecting bars from titanium with bonded bases. We also use titanium bonded bases for our zirconium abutments since we have had experiences with whole zirconium abutments with screw connection - they loosened over time. For lateral applications we also fabricate titanium abutments which we weld to the bonding base. The design of these abutments too is amazingly simple: One draws what one thinks.

Mr. Kaufmann, many thanks for this interview.

NEW: Philips Sonicare FlexCare Platinum
For outstanding cleaning, even deep between the teeth

Philips has the right sonic toothbrush for every cleaning need. The latest innovation is called Philips Sonicare FlexCare Platinum. Its innovative pressure sensor gives immediate feedback in a simple manner if too much pressure on the brush head minimizes the vibrations. This makes the Philips Sonicare FlexCare Platinum ideal for those of your patients who are worried about using too much pressure when cleaning with an electronic toothbrush. Nine individual settings and intensity levels thereby make adaptation to the individual cleaning requirements possible.

Pressure sensor
This innovative sensor gives simple and intuitive feedback if the brush head is pressed down too hard.

3 cleaning settings
- Clean – ensures optimal plaque removal (standard)
- White – removes discoloration of the tooth surface in 2 minutes, and the front teeth are whitened and polished in a further 30 seconds.
- GumCare – combines 2 minutes in the Clean setting with 1 minute of gentle gum massage for healthy gums.

3 intensity levels
Maximum comfort with the 3 adjustable intensity levels: low (for sensitive areas), medium and high. Each of the 3 intensity levels can be combined with each of the 3 cleaning settings.

Philips Sonicare InterCare brush head
Extra long filaments reach deep into the spaces between teeth and ensure an excellent plaque removal there compared to a manual toothbrush. For better tooth and gum health.

UV-Sanitizer
With the UV light technology from Philips, up to 99% of the bacteria and viruses on the brush head are rendered harmless – in only 10 minutes.

Lithium-ion rechargeable battery
With 3-week working life

Removes up to 6x more plaque in the spaces between the teeth in comparison to a manual toothbrush.
The Inman Aligner: A progressive approach to smile design - Part 2

By Dr Tif Qureshi

The following article is Part 2 in a series discussing the use of the Inman Aligner as a tool for minimally invasive cosmetic dentistry. The first article (published in DTME Nov-Dec 2013) demonstrated that standalone treatments offer patients an alternative to both fixed braces, which are unsightly and have long treatment times; and to expensive clear aligner treatments in suitable cases. This article will demonstrate that patients who desire a more traditional smile makeover can achieve beautiful results in a more progressive manner that allows them to make their choices along the way. This often results in virtually no removal of tooth structure and a treatment result with the responsibility of decision-making shared between dentist and patient.

Moreover, the subject matter of this article could potentially start one of the most controversial debates in cosmetic dentistry for years. We are not only discussing a radically different approach to smile makeovers, but critically a sharply different approach to the traditional methods of planning smile design.

What would you choose? Patients entering cosmetic practices are often assessed at the initial consultation. They have digital photographs taken and perhaps study models are made. Normally, dental imaging software is used to show patients what can be achieved. These ingenious programmes (see www.snapdental.com/ AUST) can help patients visualise what is possible. Naturally, care must always be taken when promising treatment results that are viewed digitally.

While computer imaging can be a very powerful tool to help the patient see the potential in his/her smile, I believe it also can make a patient focus on a certain prescribed goal that may not be the only way of satisfying his/her wishes. Dentists using imaging would ideally create a set of five to ten different outcomes of varying degrees of improvement to allow the patient to make a more informed decision. While ideal, it is not certain that dentists actually present different levels of treatment to their patients digitally. Even if they were able to see various images of their teeth, it can still be difficult for a patient to really see and feel the suggested changes in their mouth. One can question the ethics of allowing patients to commit to a potentially irreversible procedure based on 2-D photographs.

Three-dimensional wax-ups can also be very useful at this stage. If a patient is keen on the image, going to an additive wax-up can sometimes allow for a direct preview try-in using a silicone stent taken from set-up. Temporary material of various shades can be tried in directly, without any bonding to allow the patient to see the proposed outline, form and overall aesthetics.

Despite this, veneers are often used to treat alignment issues and it is very difficult for patients to appreciate the alignment of their own teeth with wax-up or imaging. By approaching these cases with a different protocol in mind, a dramatically less invasive treatment plan becomes evident.

“We are not only discussing a radically different approach to smile makeovers.”

The first step is to look at the patient’s tooth alignment. Mis-aligned teeth often cause issues in gum heights, line angles, light reflections, shades and tooth length. Correcting the misalignment first can create a completely different perception of the apparent problems. Next, the teeth should be bleached. This can be done either immediately after the teeth have been aligned or preferably simultaneously. After alignment and bleaching, edge bonding (we term this the ABB concept) should be offered to improve the incisal edge outline.

This combination of treatments also works well because the Inman Aligner is a removable appliance and only needs to be worn 10 to 18 hours a day. This means simultaneous bleaching is very possible and straightforward. A recent study from Sweden indicates a cost-benefit advantage of treating patients with removable appliances in general dental clinics, rather than with fixed appliances at specialist orthodontists. The conclusion of this study is significant, since a popular choice amongst aesthetic dentists in the UK is removable orthodontics.

The cases outlined here highlight patients who, either at the start of treatment or for years, had originally wanted veneers and had a specific result in mind that only veneers could have offered quickly. They were all concerned about the degree of preparation required, so undertook alignment first. Then, part of the way through, started bleaching and very quickly changed their minds about what they wanted once they saw their own teeth improve.

Case 1 (Figures 1-8) Laura was concerned about her very prominent central incisors. She wanted to have them straightened and had considered veneers. She had ruled out conventional orthodontics and invisible braces because she wanted a quick treatment and did not want anything stuck to her teeth, which is the reason that she had refrained from orthodontic treatment. Several years ago, she may well have had veneers placed.

On viewing her teeth before the occlusal photograph, it was quite clear that this would have involved massive preparation of the upper teeth.
central teeth. Preparation would have been well into dentine and may have even involved elective endodontics. Her lateral teeth would have needed little preparation, but the emergence profiles would have been poor, creating unrealistic aesthetic indices and a possible periodontal risk later on. Instead, the alignment was completed with an Inman Aligner in ten weeks. Her treatment sequence is detailed below.

BACD-style digital photographs were taken and the amount of crowding was calculated using an electronic crowding calculator, which can also be done by arch evaluation of the patient’s study models. We measured the ideal curve and subtracted this measurement from the total mesio-distal widths of the teeth being moved. The results showed that there was only 1.6 mm crowding. This seemed less than one would have expected; the reason for this was that because the lateral incisors were being pushed out, the arch was being expanded, thus creating space. It was clear from the photographs that despite the obvious crowding, there was some less obvious irregular outline caused by differential tooth wear. It was important to indicate this to the patient, as this would become more evident once the misalignment had been corrected. The patient was quoted for three incisal composite (Figures 9-17) preparations to achieve the correct alignment with veneers, she had hoped for a more restrained smile, the patient exclaimed that she felt her smile after alignment was better than she had imagined her veneers would have been. Had veneers been placed, we could perhaps have corrected the golden proportion more fully, balanced the zirconi, improved the canine outline, widened the buccal corridors, etc. However, that was clearly not what the patient desired. Should she later decide that she does need further improvements, we can proceed with already prepared veneers.

The patient then enquired about fixing the edges. The patient was thrilled with the result we achieved using an Inman Aligner and some simple bonding. She described that when she had once considered having veneers, she had hoped for a similar result. There are still minor imperfections, but, in my opinion, these contribute to her natural beauty.

There is a stark contrast between the treatment selected and the potential treatment approaches in this case. Where once a patient, who refused orthodontics, would have consented and received highly aggressive tooth preparations to achieve correct alignment with veneers, now a removable aligner and some simple bonding were able to achieve a similar and arguably better result in less than three months with not a micrometer of tooth reduction needed.

Case 2 (Figures 9-17)

This young lady had been attending my practice for some time and was aware of porcelain veneers, having seen our previously advertised cases. We had spoken about the aesthetic benefits of veneers years before. However, on reviewing her case, it was clear that we could improve her alignment dramatically with an Inman Aligner in a short period.

We took an occlusal image of her anterior teeth and outlined the amount of tooth structure that would have to be removed to produce veneers that would look aesthetic. It was immediately apparent to the patient that alignment of her teeth would offer a possibly better treatment outcome. Her case was suitable for an Inman Aligner and as only 2.5 mm crowding was present, this meant it could be treated quickly and simply. Her Inman Aligner was fitted and IPR performed progressively over three visits. At week eight, upper and lower bleaching trays were constructed even though her alignment was not yet complete. Home whitening was begun with clear and concise instructions. We used rubber trays with a deep seal cut into the model to create a tight dam effect. Over two weeks, her teeth whitened nicely and at week tea, she returned for a review.

Interestingly, the patient’s perception of her smile had changed dramatically. Owning to the improved line angles, whiter teeth and aligned gum heights, her eyes were now drawn to the irregular outline caused by chipping and differential wear.

The patient then enquired about fixing the edges. We offered to bond the incisal edge with virtually no preparation. A hybrid composite (Tetric Flow, Ivoclar Vivadent) was placed palatally and incisally with a microfill on the facial surface. This was done in B2 and B1 shades to match the bleaching. The patient was delighted with the result and a wire retainer was bonded immediately.

Despite some clear deviations from her ideal simulated smile, the patient explained that she felt her smile after alignment was better than she had imagined her veneers would have been. Had veneers been placed, we could perhaps have corrected the golden proportion more fully, balanced the zirconia, improved the canine outlines, widened the buccal corridors, etc. However, that was clearly not what the patient desired. Should she later decide that she does need further improvements, we can proceed with already prepared veneers.

In this manner, the patient is given the opportunity for decision-making in his/her treatment and the responsibility in choice is shared.
Case 3

This patient presented with

oncusal view, the patient became aware of the extent of aggres-
sive tooth preparation that would be required to place a veneer. She under-
stood that her teeth needed to be aligned before decid-
de on the next step in design.

An Inman Aligner was used over the period of several weeks to rotate the front tooth and to tip out the lateral.

Case 3

remaining six months

and was simply filled with a nano-hybrid composite (Ves-

tually polished vertically using rubber sticks (PoGo, Ve-

I believe this approach firmly sits alongside minimally invasive cosmetic dentistry core principles, which recommend a more minimally invasive and patient-led approach.

Conclusion

I understand the controversy in challenging the tradition-
al approach to smile design, but it is now possible to achieve
great significance when measuring patient satisfac-
tion of treatment results.

there are many anecdotal stories about patients who had technically beautiful veneers placed but found that these simply did not meet their desires. The problem is that even with no-prepara-
tion veneers, an irreversible procedure has been under-

Case presentation: OptiBond™ XTR

By Claude Finelle

This 85-year-old patient, who was in good health, came for a consultation to “improve his smile”.

This was motivated by jokes made by his grandchildren about the condition of his teeth. Primarily, the 6 anterior maxillary teeth were involved. There was no particular request to lighten the smile.

During the first consultation, the clinical examination revealed the presence of numerous cervical lesions, as well as fractures of the incisive edges of 11 and 21.

The above-mentioned fractures of the free edges of the central incisors, the presence of a carious lesion on the mesial surface of 11, an old composite on the mesial surface of 21 and the patient’s complaint about the elongation of the two centrals led us to opt for two all-ceramic e.max crowns made of feldspathic ceramic reinforced with lithium disilicate. Taking into account the patient’s age, this therapeutic choice was not hindered by the proximity of a high volume of pulp.

We selected e.max in the hope of achieving better aesthetic integration, with its transulence allowing the saturated and natural appearance of the underlying preparations to show through.

This type of all-ceramic restoration allows us to take advantage of bonding, which appeared to us to be the best solution on the vital teeth. (We used the bonding agent to seal the dentinal tubules and improve the sealing of the cervical limits.)

We remedied the cervical wear on all of the teeth, including the central incisors (from 14 to 25). For this treatment, we used OptiBond™ XTR, a two-step, self-etching adhesive system (SAM2), and Miris composite in shade S6.

The central incisors were then prepared by cutting back the marginal limits inside the vestibular composite itself, in the manner described above.

We used the green-ringed tip (Komet) followed by the red tip bar for polishing, under heavy irrigation. The preparations were carried out with optical assistance (magnification X 2.5) and the limits were adjusted gingivally.

An impression of the 2 preparations was made during the same appointment. One week later, the two crowns, made by LNT laboratory in Paris, were delivered to the practice. They were tried in and then etched with 5% hydrofluoric acid for 20 seconds. Once the acid had been neutralised and the surface carefully dried, a layer of OptiBond XTR universal adhesive (bottle no. 2) was applied to the restorations’ internal surface shortly before application of the adhesive.

The advantage of OptiBond XTR is its ability to adhere to all types of prosthetic substrates without preparation or initial priming. This allowed us to perform our bonding procedures more efficiently, dealing with both restorations at the same time regardless of the prosthetic material. The adhesive treatment of the preparations was carried out with the same OptiBond XTR and, in this case, we applied a first layer of the primer, OptiBond XTR Primer (bottle no. 1), which was brushed onto the enamel and the dentine for 20 seconds and then dried for 5 seconds. We were careful to dip the brush in several times during the application process, to ensure fresh acid was being brought into contact with the dentinal surfaces each time and to optimise etching.

Before applying OptiBond XTR Adhesive (bottle no. 2), we were careful to shake the bottle lightly to ensure homogeneity
Two phase treatment of a Class II division 1 patient complicated by traumatic upper incisor intrusion: A Case Report

By Dr. Roelien Stapelberg

A female patient presented at the age of 7 years and 8 months with the complaint that one of her upper teeth was absent. She had a mild thumb sucking habit with a tongue thrust. She had a Class II division 1 incisor relationship on a Class II skeletal base with mildly decreased vertical facial proportions.

Extraoral examination (Figure 1a-c)

Extra-orally the patient presented with a Class II skeletal pattern convex profile and accentuated labiometal fold. She had acceptable vertical facial proportions. The frontal examination revealed acceptable facial symmetry and balance, with the upper central incisors coincident with the midfacial axis. Soft tissue examination demonstrated thin upper and lower lips with mild incompetence, as well as an acute nasolabial angle. The lower lip was retrusive to Rickett’s E-line.

Intraoral examination (Figure 1d-h)

The patient was in the early mixed dentition and had good oral hygiene. There was no history of dental caries, and no active dental caries. Mild generalized extrinsic staining was present. Furthermore, there were no restorations present. The maxillary arch was symmetric and tapered, whereas the mandibular arch was square and symmetric. Both arches had no space deficiency and had well aligned buccal segments. The upper right central incisor was missing, and the upper left central incisor was protruded. In occlusion, the overjet measured 10mm, with no overbite present. The molar relationship was left Class II, and the right side was ⅔ Class II. The lower centerline was 2mm to the left of the upper centerline, which was coincident with the facial centerline. There was no crossbites or displacements.

The Dental Health Component (DHC) of the Index of Orthodontic Treatment Need (IOTN) was 5f, and the Aesthetic Component (AC) was 9.

Radiographic examination (Figure 2a,b)

The DPT demonstrated that all second molars were present and developing, as well as the lower third molars. The upper right central incisor seemed to be horizontally impacted. The cephalometric analysis confirmed our clinical findings of a Class II skeletal pattern with an ANB of 7°. The Wits appraisal confirmed the Class II skeletal pattern with a measurement of 7.5 mm. The vertical proportions were slightly decreased, demonstrated by the maxillary-mandibular plane angle of 107° and face height ratio of 52.1%. The upper incisors were severely proclined at 128.5°, as was the lower incisors at 106°. The lower incisors were retruded relative to the AP line with a measurement of 0.8mm.

Problem list

1. UR1 Horizontally impacted
2. Class II skeletal pattern due to mandibular retrognathia
3. Convex profile
4. Increased overjet
5. Lower centerline 2mm to the left of the upper centerline
6. Aims and Objectives
7. Facilitate eruption of UR1
8. Correct Class II skeletal pattern by encouraging mandibular growth
9. Improve facial profile
10. Decrease overjet to within normal range
11. Establish coincident centerlines
12. Maintain result until comprehensive orthodontic therapy

Treatment plan

1. Upper hybrid TPA - tongue crib appliance to assist in breaking the thumb sucking habit and relieve the present tongue thrust, while reinforcing the anchorage of the UR6 & UL2.
2. Upper 2x4 pre-adjusted edgewise fixed appliances (0.022” x 0.028” slot) with MFT prescription. Upper utility arch 0.016 SS with an open coil spring to create and maintain adequate space for the UR1.
3. Surgical exposure of the UR1 with the open technique with obtaining of a gold chain and orthodontic traction to the archwire to facilitate eruption.
4. Bonded upper fixed retainer UR1 to UL1 to be maintained until comprehensive orthodontic treatment phase.

Treatment assessment (Figure 1a-g)

The patient was a 7 years and 8 months old Caucasian female presenting with a Class II division 1 incisor relationship on a Class II skeletal base with mildly decreased vertical facial proportions. The mandible was retrognathic, and the maxilla normal. The malocclusion was complicated by a horizontally impacted UR1. The patient presented with no space deficiency. The upper centerline with on the facial midline, and the lower centerline was 2mm to the left of the upper. The molar relationship was full unit Class II on the left and ⅓ unit Class II on the right.

Phase 1 treatment was deemed appropriate, and consisted of a hybrid TPA-tongue crib appliance with a 2x4 upper pre-adjusted edgewise fixed appliances (0.022” x 0.028” slot) with MFT prescription. Surgery...
A female patient presented at 9 years 4 months of age for a retention check of her fixed upper retainer, still in place from her previous orthodontic treatment (Phase I). She had a Class II division 1 malocclusion, on Class II skeletal bases, with decreased vertical proportions, bimaxillary proclination and a lower lip trap.

Intra-oral examination

The patient was in the late mixed dentition and had good oral hygiene. There were no restorations, and the patient was caries free. The maxillary arch was ovoid and symmetrical with no space discrepancy. The buccal segments were well aligned, with mesial buccal rotation on the UR6 and UL6 present. The mandibular arch with ovoid and symmetrical with no space discrepancy, with a deep curve of Spee present. The buccal segments of the lower arch was well aligned. In occlusion the overjet measured 8.5mm, with an overbite of 5.5mm (50%). The left molar relationship was ⅓ unit Class II, and the right ⅝ unit Class II. The left canine relationship was full unit Class II, and the right was ⅜ unit Class II. No crossbites were present. The dental health component (DHC) of the Index of Orthodontic Treatment Need (IOTN) was 4a, and the aesthetic component (AC) was 9.

Radiographic examination

The DPT demonstrated that all third and second molars were developing. No other abnormalities were found. The cephalometric analysis (Table I) confirmed a skeletal Class II antero-posterior discrepancy as demonstrated by an ANB of 3.8° and a Wits appraisal of 6.5 mm. Both the upper and the lower incisors were severely proclined (134.7° upper & 104.5° lower), with the lower incisor in a relative normal position in relation to APL line (0.6 mm).

Phase II

Aims and Objectives

1. Utilize favorable mandibular growth for improvement of the Class II skeletal discrepancy
2. Improve facial harmony and increase lower lip protrusion
3. Reduce upper incisor proclination
4. Reduce overjet to normal values
5. Establish optimal buccal segment interdigitation bilaterally
6. Establish coincident centerlines
7. Obtain lip competence at rest
8. Maintain incisor display on smiling
9. Place teeth in a position compatible with lower centerline being 2mm to the left
10. Retain corrected result

Problem list

1. Class II skeletal relationship due to mandibular retrognathism
2. Convex profile with reduced lower lip protrusion
3. Upper incisor proclination
4. Overjet of 8.5 mm
5. Asymmetric Class II molar and canine relationship
6. 2 mm lower centerline discrepancy to the left of the upper dental midline
7. Incompetent lips at rest

Treatment plan

1. Upper removable appliance while waiting for eruption of the upper second premolars and the growth spur to occur. Appliance manufactured with an expansion screw to establish adequate maxillary dentoalveolar width to accomplish mandibular forward posturing without occlusal interferences from a crossbite tendency, with a slow advancement on the 12 to obtain initial alignment.
2. Andreason’s Activator appliance for mandibular growth stimulation with wax bite of approximately 5mm was given after the growth spur was reached as evaluated by clinical examination. Capping of lower incisors was done on the Activator to minimize lower incisor proclination.
3. Full upper and lower pre-adjusted edgewise fixed appliances (0.022” x 0.028” slot) with MBT prescription was placed after Class I canine was achieved with the Activator.
4. Bonded upper fixed retainer individually from UR5 to UL5 and upper vacuum formed retainer to be worn at night time only and a bonded lower fixed retainer individually from LR3 to LR5.

Figure 2 (a,b) Case 1. Pre-treatment radiographs
Class I canine relationship bilaterally and a waxbite thickness of 5mm (Figure 5). The compliance with the Activator was excellent, and after 5 months of wear the patient was ready for fixed appliances. A cephalogram after the Activator treatment was taken and analyzed (Figure 6). The cephalometric analysis (Table 2) revealed a skeletal Class I antero-posterior relationship (ANB 3.6°, Wits appraisal 2.8 mm). The SNA reduced during the use of the Activator, which was the cause for the reduction in the ANB angle. The SNB remained almost the same. The vertical proportions indicated a mildly anterior growth rotation. The upper incisors retroclined, and the lower incisors proclined after the Activator use. The upper incisors were severely proclined with 120°, and the lower incisors as well with 111.5°. The lower incisors protruded in relation to ANp (5.2mm), 0.022 slot preadjusted edgewise fixed appliances were placed, with the leveling and aligning phase initiated with 0.016” heat activated Nickel Titanium archwires in the upper and lower arches. The archwires progressed to 0.019 x 0.025” heat activated Nickel Titanium in the upper and lower arch, followed by customized and coordinated 0.019 x 0.025” stainless steel archwires with steel ligatures. At this stage the patient was advised to use Class II intermaxillary elastics (5/16” 3oz) bilaterally full time to correct our canine relationship after mild relapse occurred during the alignment and leveling phase of the fixed appliances. The intermaxillary elastics were continued for 4 months. During the torque expression of the rectangular steel wires, mild spaces opened in the upper arch, these spaces were closed with friction mechanics utilizing a closed elastomeric chain.

continuing the care that starts in your chair
1 COMPLETE SENSITIVITY TOOTHPASTE
SPECIALLY DESIGNED WITH 7 BENEFITS*

All-round care for dentine hypersensitivity patients*1-6

We are constantly evolving our specialist range to meet the differing needs of dentine hypersensitivity patients. That’s why we developed Sensodyne® Complete Protection.

*With twice daily brushing

1 denture

Everyday, day after day, your patient’s denture will have to support thousands of tasks. So it’s little wonder that even people with well-fitting dentures will have problems with trapped food, fears their denture will dislodge or a concern about bad breath.

This is where a Daily Denture Care Regime from Corega fits in

Corega adhesive
- Proven to improve bite force by 38% in well-fitting dentures,¹ which improves your patient’s ability to eat difficult foods
- Provides all day hold and helps seal out 74% more food particles compared to no adhesive,² helping to reduce the irritation and pain they cause

Corega cleanser
- Proven to manage denture hygiene effectively*²
- Reduces plaque build-up with proven¹ bactericidal¹ and antifungal activity³

1 denture care regime

By recommending a Daily Denture Care Regime to your patients with dentures, you can be assured that you are helping to improve their comfort and confidence every day, day after day

This is where Corega fits in

*When used as directed. In vitro
chain from upper right to left first molars. A cephalogram was taken after correction of the anterior posterior relationship to check the incisor inclinations and evaluate the patient for the possibility of extraction. The upper incisors were proclined, as was the lower incisors, however, the lower incisors did not procline more than the pre-treatment value, and the facial appearance accepted the increased proclination. Therefore no ex-
tractions were done to decrease the incisor proclination.

Finishing and detailing was done on a 0.018 stainless steel wire. The estimated treatment time for Case 1 treatment was 24–50 months. The actual treatment time was 22 months. Retention was initiated with an upper vacuum formed retainer and a lower fixed 3 retainers.

Case 1 assessment (Figure 9)

Case 1 presented to the orthodontic clinic at the age of 7 years 8 months, with a Class II division 1 incisor relationship on a Class II skeletal base with mildly decreased vertical facial proportions. The mandible was retrognathic, and the maxilla normal. The malocclusion was complicated by a horizontally impacted UR1. The upper centric line was on the facial midline, and the lower centerline was 2mm to the left of the upper. The molar relationship was full unit Class II on the left and ½ unit Class II on the right. The upper and lower incisors were severely proclined, with the lower incisors in normal position relative to the APo line.

Orthodontic camouflage for the underlying Class II skeletal discrepancy was carried out. On initial examination it was clear that the upper and lower incisors were proclined. LOWER incisor proclination would indicate the amount of correction that can be attained by orthodontics only. For Case 1, the lower incisors were se-

Invisalign®: clear benefits for your patients

By Vicki Vlaskalic BDSSc;
MDSc.

S
ince the launch of the revolutionary Invisalign orthodontic system in 1999, the removable, computer activated, aesthetic Invisalign® aligner has gained popularity world-wide as an alternative to traditional fixed appliances. Invisalign® provides adult and teen patients an aesthetic, non-invasive and precisely activated treatment alternative for improving smile aesthetics and occlusal requirements, from minor alignment to complex malocclusions. Currently Invisalign® is available to patients in over 60 countries, with over 85,000 clinicians trained to use the product and over 2.8 million patients treated or in treatment. 1,2

Due in part to the digital occlusal data from millions of treated patients, Align Technology Inc. (the manufacturer of Invisalign®) has been able to continuously support rapid innovation. Some improvements include interactive ClinCheck® software features, new FDA approved aligner materials, algorithms based features such as optimized attachments, specifically engineered to the tooth’s shape, size and requested movement (Figure 1), hooks and cut outs for applying Class II and Class III mechanics, power ridges for assisting expression of root torque and eruption ponics for treating late mixed dentition patients 3,4 (Figure 1).

In 2014, the newest series of innovations “Invisalign G5” was launched, including an integrated mechanical system for treatment of dental deep bite cases. Invisalign® mechanics are well suited to dental and mild skeletal Class III cases due to the occlusal coverage and lack of detrimental extrusive vertical side effects. 5,6

Intra-orally, the patient displays a Class I molar and ¼ unit Class II canine relationship with mild upper and lower crowding and open bite extending from right second premolar to left first premolar region. Her overbite is deficient (2.2mm) and overjet excessive (8mm). Her arch forms are non-coincident in shape, with a narrow upper arch form due to part to palatal inclination of the upper dentition. There is generalized gingival recession with significant recession and active inflammation involving the lower left lateral incisor (Figure 4).

The treatment plan was to align and coordinate the arch forms, increase buccal crown inclination and to reduce the overjet and close the anterior open bite using relative incisor extrusion (tipping back), leaving a partial curve of Spee in the lower arch due to an already “gummy smile”. Space acquisition for resolution of crowding and relative incisor extrusion would be via conservative arch expansion (buccal crown inclination rather than bodily expansion) and computer calculated interproximal reduction of anterior segments. Initial periodontal treatment of the lower left incisor segment and general periodontal maintenance through treatment was prescribed. Mechanics selected was the Invisalign® system due to the desire of the patient for a high degree of aesthetics (she was married half way through treatment), excellent vertical control, accurate mechanics and ability to plan of treatment prior to initiating mechanics and ability to maintain a high level of oral hygiene through treatment. A 3D ClinCheck® Plan was developed, based on PVS impressions and the Invisalign prescription form (Figures 5 & 6).

For this patient, the benefits of Invisalign® ClinCheck® Software planning (Table 1) with the ability to superimpose and view degrees of movement and to have the ability to program small, precise activation in the aligners made treatment predictable in terms of vertical control and preserving periodontal health. In this case, the patient would not consider a surgical option and there was no obvious functional aetiology for the open bite. Post treatment stability, even of open bite patients and incidence of root resorption have been found to be favorable with the Invisalign system. 7,8

Table 1 : Advantages of ClinCheck® Software

- 3D visualization of each planned treatment, including the treatment duration for clinicians and patients.
- Accurate crown and generic root programming and assessment of movement and direction of movement.
- Interactive tools to design mechanics such as attachment choice, Class II and Class III correction features.
- Clinical tool for treatment monitoring and motivation enhancement.
- Tooth movement animation may be used by colleagues in non-disiplinary planning.

Summary

The Invisalign® system has many unique benefits to offer both patients and clinicians. Its distinct 3D ClinCheck® software not only provides a valuable planning tool but it directly programs the activation of the aligners, offering for the first time, aligners designed with multiple small and precise tooth activations engineered to produce predictable movement and occlusal conclusions. The scope of related research conducted by the manufacturer as well as by the private dental and academic communities is unique to Invisalign®, and offers significant scientific value to users, with over 500 publications and case reports around the globe. As a result, the Invisalign® system has continually evolved to become a predictable orthodontic appliance applicable to all categories of malocclusion, including extraction and surgical treatments (9), depending largely on the treating doctor’s level of experience using Invisalign®.

Periodontitis, Diabetes and Smoking

By Drs Khawla Al Matroushi, Dr. Shatha Al Khatri and Professor Crawford Bain, Dubai School of Dental Medicine

Periodontal diseases have, for a half of a century, been known to be initiated by the accumulation of bacterial plaque (R). It has however been increasingly apparent in recent years that extrinsic and intrinsic risk factors influence the progression of periodontitis. Of these the most important are Diabetes and Smoking. Since both of these factors are common in the UAE this is of particular importance to UAE dentists. It is the purpose of this paper to review the current understanding of these factors and to discuss the likely bi-directional relationships between management of periodontitis and these factors.

Periodontitis and Diabetes

Diabetes mellitus occurs when the level of sugar (glucose) in the blood becomes higher than normal. There are two main types of diabetes. In type 1 diabetes the body stops making insulin and the blood sugar (glucose) level becomes very high (R). Type 2 diabetes, also called adult-onset diabetes and noninsulin-dependent diabetes, is a chronic condition caused by high levels of glucose (sugar) in the blood. Although some people can overcome the symptoms by losing weight and following a healthy diet and exercise plan, most people with type 2 diabetes will have it for life (R).

Both diabetes and periodontal disease are chronic diseases. Diabetes has many adverse effects on the periodontium, and conversely periodontitis may have deleterious effects further aggravating the complications of diabetes. The potential common pathophysiologic pathways include those associated with inflammation, altered host responses, altered tissue homeostasis, and insulin resistance. A recent study also showed that scaling, polishing and root planing of the periodontal lesion can lower blood sugar levels potentially offering a practical means of reducing the numbers who develop full type 2 diabetes (R).

Diabetes has many adverse effects on the periodontium, including decreased collagen turnover, impaired neutrophil function, and increased potential for destructive processes (R). Neutrophil chemotaxis and phagocytic activities are compromised in diabetic patients, which can lead to reduced bacterial killing and enhanced periodontal destruction. Inflammation is exaggerated in the presence of diabetes, insulin resistance, and hyperglycemia (R).

Neelima et al (R) examined 1500 diabetic patients; the prevalence of periodontal disease in these patients was 86.8%, significantly higher than the general population. By the early 1990s periodontitis was referred to as the "sixth complication of diabetes", and in 2005 the ADA formally acknowledged that periodontal disease is more often found in diabetics (R). Epstein (R) demonstrated that essentially all aspects of bone growth and mineralization are diminished in the absence of insulin i.e. hyperglycemia. Vascular changes also increase with increase in blood glucose levels (Oliver and Tervonen) (R).

Periodontitis and Smoking

Second to a bacterial plaque, smoking is the strongest of the modifiable risk factors for periodontal disease. Smokers harbor a higher prevalence of potential periodontal pathogens, and smoking impairs various aspects of immune responses, including neutrophil function, antibody production, fibroblast activities, vascular factors and inflammatory mediator production (R).

In smokers inflammation in response to plaque accumulation is reduced compared with nonsmokers and smokers have a decreased expression of gingival inflammation and bleeding on probing in the presence of plaque accumulation when compared with nonsmokers (R).

Smoking has been associated with a two- to eight-fold increased risk for periodontal attachment and/or bone loss, depending on the definition of disease severity and smoking dose. One of the largest epidemiological studies reporting a correlation between smoking and periodontitis included 12,329 U.S. adults 20 years and older. In this study, current smokers were four times as likely to have periodontitis compared to nonsmokers after adjusting for age, race, ethnicity, income, and educational level. Heavy smokers (≥ 31 cigarettes per day) using a stricter definition of periodontitis (mean whole mouth attachment loss of ≥ 4mm), the adjusted odds ratio was increased to 25.64 among smokers aged 50 years or more (R). Longitudinal studies have demonstrated that young individuals smoking more than 15 cigarettes per day showed the highest risk for tooth loss (R).

Smokers have a greater extent of colonization by periodontal pathogens than nonsmokers or former smokers, particularly at shallow sites (pocket depth ≥ 4mm) with no differences between smokers, former smokers, and nonsmokers in pockets ≥ 4mm (R). This colonization, along with low gingival blood flow may lead to an increased prevalence of periodontal breakdown (R).

Smoking exerts a major effect on the protective elements of the immune response, resulting in an increase in the extent and severity of periodontal destruction. Neutrophils obtained from peripheral blood or saliva of smokers, have been shown to demonstrate functional alterations in chemotaxis, phagocytosis, and the oxidative burst. Smoking has been shown to impair the chemotaxis and phagocytosis of neutrophils obtained from the oral cavity, and in vitro studies of the effects of tobacco products on neutrophils have shown detrimental effects on cell movement and the oxidative burst (R).

Discussion

Both diabetes and smoking are increasing in the UAE particularly in younger individuals. Since scaling, polishing and root planning have been shown to lower blood sugar levels, and since smoking cessation improves the periodontal condition in many of these patients, it is the responsibility of all dental professionals to provide comprehensive periodontal care for all diabetics and pre-diabetics, and to provide accurate smoking cessation advice with appropriate referrals as indicated. The situation can be compounded when a diabetic also has a smoking habit.

The relationships between Periodontitis, Diabetes and Smoking are major areas of research interest at Dubai School of Dental Medicine. The special area of research interest at Dubai School of Dental Medicine is related to the MSc in Periodontics which is located in Dubai Healthcare City (DHCC). Dr. Crawford Bain is Professor of Periodontology, and Director of the MSc in Periodontics at Dubai School of Dental Medicine (DSM) located in Dubai Healthcare City (DHCC).
Get to Know the IFDH

By JoAnn R. Gurenlian, RDH, PhD

The International Federation of Dental Hygiene (IFDH) is an organization designed to represent the interests of dental hygienists worldwide. Originally founded in 1973 by the International Liaison Committee on Dental Hygiene, the organization was formalized in 1986 in Oslo, Norway. Since that time, the IFDH has functioned as an international, non-governmental, non-profit organization that unites dental hygiene associations from around the world in the common cause of promoting oral health.

The purposes of the IFDH include the following:

• Safeguard and defend the interests of the profession of dental hygiene worldwide, and reinforce and advance the profession of dental hygiene.
• Promote professional alliances with its associations members as well as with other associations, federations, and organizations whose objectives are similar.
• Promote and coordinate the exchange of knowledge and information about the profession, its education, and its practice.
• Promote access to quality preventive oral health services.
• Increase public awareness that oral disease can be prevented through proven regimens. Awareness and understanding of discussion of issues pertaining to dental hygiene.

Currently, the IFDH consists of 26 member countries. These include: Australia, Austria, Canada, Denmark, Fiji, Finland, Germany, Ireland, Israel, Italy, Japan, Korea, Latvia, Nepal, Netherlands, New Zealand, Norway, Pakistan, Portugal, Russia, Slovak Republic, South Africa, Spain, Sweden, Switzerland, United Kingdom, and United States of America. Individual dental hygienists, students enrolled in accredited dental hygiene education programs, and other professional organizations and health care providers may join the IFDH.

The IFDH endeavors to provide online resources for dental hygiene colleagues. Our website, www.ifdh.org, provides information about the process of seeking employment in member countries, research and education, national and international meetings of interest, as well as new trends and partnerships designed to improve the oral health of the public.

One of our exciting new partnerships is with the Global Child Dental Fund. We are working together to support a social responsibility award focused on improving the oral health of disadvantaged children. This volunteer project is designed to recognize, on an international basis and student dental hygienists and student dental hygienists who participate in a volunteering project which benefits disadvantaged children, mainly, but not exclusively, in low- and middle-income countries. Any dental hygiene who is either an Individual or Student member of the IFDH, or an IFDH Country Member is eligible to apply for the award. Applications are available through www.gclfund.org. Project proposals are due by June 1, 2014 and awards will be announced on September 30, 2014. One winner will receive a cash prize of $5000 to implement their project, with runners-up receiving cash prizes of $1000 for their project.

In addition, the IFDH is investigating a partnership with “Test2Floss”. This program is an innovative way to promote improved oral home care by texting reminder messages to brush and floss daily. Additional educational information is offered concerning oral care including saliva and the pH of the mouth, heart disease and oral health, stress, and diabetes. There is an app for adults, lipd minis, and Iphone 5s as well as through iTunes at http://itunes.apple.com/us/app/test2floss/id579706527?mt=8.

Every three years, the IFDH hosts an International Symposium on Dental Hygiene, providing an opportunity to network and learn the latest research and technologies supporting the growth of the profession. The next scientific symposium will be held from June 25 to 26, 2016 in Zurich, Switzerland. For more information about this meeting, visit http://ifdh2016.dentalhygienists.ch.

We hope you will join us as we work together to improve the oral health of the public and support our profession around the globe!

EVERYDAY RINSING

An Essential Routine for Complete Oral Health

Oral hygiene is an integral component of one’s health and well being. It aids in the prevention of dental problems such as cavities and gum disease. Tooth loss can also be prevented or delayed with proper oral care. But good oral hygiene can do more than just keep teeth and gums healthy; it can act as a mirror of one’s overall health.

Over the past decades, there has been a mounting interest in the possible interplay between poor oral hygiene and various diseases. Research has shown that periodontal disease is atherosclerotic vascular disease (ASVD) risk factor for oral health.3,4

Recent studies also have put evidence that poor oral hygiene is associated with higher levels of risk for cardiovascular diseases (i.e., heart attack and stroke) and low grade inflammation, although further research is needed to confirm the underlying nature of such association.5

Oral Hygiene Routines

The American Dental Association recommends the cornerstone of proper oral care – brushing and flossing.6

Brushing: Brushing the teeth twice a day with a soft-bristled brush is the key to healthy gums and teeth. The size and shape of the brush should fit the mouth to reach all areas easily. Toothbrush should be replaced every four or five months or when the bristles are frayed. A pea-size of fluoride-rich toothpaste may also come in handy.7

Flossing: Flossing once a day can help remove plaque from between teeth. It is an important part of the routine as plaque that stays in the mouth can eventually harden into calculus or tartar. Once tartar has formed, professional cleaning may be required for its removal.7

However, Brushing and Flossing May Not Be Enough

A strong body of evidence has shown that brushing and flossing are not effective enough to prevent dental caries and periodontal diseases. A trusted mouth rinse brand is Listerine®, the first over-the-counter mouth rinse that has been awarded the American Dental Association Council on Scientific Acceptance.8 It offers different variants that are effective at eliminating plaque-causing bacteria.9 The latest addition to the oral hygiene arsenal is Listene® Total Care Zero, which in addition to Rapid Fusion Technology, is fortified with zinc chloride ions that can reduce calculus build-up and keep teeth whiter.9 There are many optional available but make sure to pick the rinse that best meets the patient's personal care needs to guarantee a healthier mouth, a happier smile.

Launch of Dental Hygienists Supplement in the Dental Tribune Middle East

By Victoria Wilson

Dental Hygiene Therapist

Victoria Wilson,

Dental Clinic

By Dr. Maimona A. Rahim, DDS

DUBAI, UAE: The GCC Oral Health week is the annual celebration of all the efforts during the year to improve Oral Health. This year the celebrations will take place on 20th March 2014 at the Arabian Center – Al Khawanji Road in Dubai starting from 16:30 – 10:00 with the slogan being “Tooth, Health & Beauty”. The day will highlight on bad oral health habits, maintaining good oral hygiene and the importance of dental visits. The targeted audience are all age groups, children, adults, men and women.

The event will be held under the patronage of Mr. Nasser Al Budor, Director of Dubai Medical District and Dr. Aisha Sultan, Director of Dental Services at the Ministry of Health. This wonderful celebration is made possible in collaboration with Dubai School for Dental Medicine (DSDM) and sponsored by Philips, Jordan, Beverly Hills tooth paste and First Gulf Bank. Several dentists from DSDM, Al Baraha Hospital Dental Department and various different clinics from UAE will be carrying out oral examinations, education, experiments, competitions and photo shooting throughout the day. Giveaways will be distributed by Jordan and Beverly Hills with 10 electric tooth brushes being sponsored by Philips for a competition. Balloons will be distributed by DSDM. The success of this event will be brought together by a team work of all including the Mall administration, Sponsors, Dentists and Audience.

All are invited and welcome to celebrate with us World Oral Health Day.

Celebrating World Oral Health Day
20th March 2014

Dr. Maimona A. Rahim, DDS

DUBAI, UAE: It is my pleasure to announce the launch of a new Supplement in the Dental Tribune Middle East targeted completely to Dental Hygienists.

It is an extremely exciting time for Hygienists in this region, as we continue to gain more recognition for our skills and qualifications. Dental professionals are increasingly becoming aware of our key role within the dental practice, both as a valued team member in the delivery of complete dental care, and in the promotion and restoration of our patients’ oral health.

In 1906, Alfred Fones, an American dentist from Bridgeport, Connecticut, who is also the founder of the Dental Hygienist profession, had an important vision. He wanted to create a new paradigm for dentistry that focused on prevention and promotion of oral health instead of simply tooth loss and disease. Alfred’s cousin, Irene New, became the first known Dental Hygienist and in 1915 they opened the first dental Hygiene School.

After qualifying as a Dental Hygienist & Dental Therapist from the Eastman Dental Hospital in the UK over 10 years ago, I became acutely aware of the public’s lack of knowledge as to what we do within the dental clinic. At that time, a good deal of further education was also required to educate people on our role within the community. Ten years has passed and it would now be difficult to find a clinic in the UK without a Hygienist. I can also see that this is the direction that clinics are taking in the UAE. The prevention and education that Hygienists provide is fundamental to all dental treatments.

The question still remains in the Middle East - does every member of the dental team completely understand what the Hygienist can bring to the clinic?

The following list can help provide an insight into our skills and valuable contributions. The Dental Hygienist will:

- Provide dental hygiene care to patients.
- Plan the delivery of care for patients to improve and maintain their periodontal health.
- Obtain and evaluate a detailed dental and medical history from patients.
- Complete periodontal examinations and charting and use indices to screen and monitor periodontal disease.
- Provide preventive oral care to patients and liaise with dentists and patients on the treatment of caries, periodontal disease and tooth wear, as well as replacement of existing deficient restorative treatment.
- Undertake supragingival and subgingival scaling and root debridement using manual and powered instruments and administer appropriate antimicrobial therapy to manage plaque related diseases.
- Apply topical treatments and fissure sealants.
- Offer patients advice on how to quit smoking.
- Take, process and interpret various film views used in general dental practice.
- Take impressions.
- Identify anatomical features, recognize abnormalities and interpret common pathology as well as carry out oral cancer screening.
- Refer patients to other dental professionals and discuss opinions for further dental treatment.
- Perform Tooth Whitening procedures to the prescription.
- Act as overall Team Builder.

The Dental Hygienist is ultimately a great communicator within the team. He/she motivates patients and helps them to make the right decisions for long term dental health and acts to build the practice. Successful periodontal therapy, and the maintenance of a healthy periodontium is the basis of all good restorative dentistry.

The number of Dental Hygienists in the region is steadily growing, and thanks to the Dental Tribune Middle East, we now have a platform to reach out and connect further with the dental profession.
How do you see the relationship between the dentist and laboratory evolving? New digital impression technologies will improve the relationship between the laboratory and the dentist. The proliferation of this technology, as well as advancements in dental materials and equipment, will continue to make open and consistent communication between the dentist and dental technician absolutely crucial. New software, such as Planmeca’s Romexis, will facilitate this communication through better data management and open architecture, allowing for the easy import and export of digital files to and from any system, and as acting as the conduit that brings all the case data together. Additionally, digital impressioning will open new avenues for laboratories to perform more complicated and demanding restorations in less time.

What are some of the critical factors that laboratories need to consider when working with their dental partners? Communication is critical to achieving the best results. Today’s technology opens the door to open lines of communication and I would encourage laboratories to use those tools to design more effective solutions in cooperation with their dentists. As these technologies continue to evolve and become more commonplace, the integrating relationship between dentists and dental technicians will allow for increased productivity for both sides.

Are there any systems on the market today that smaller laboratories can afford? Yes. Scanning systems continue to become more affordable. This allows everyone equal access to digital technologies and will help laboratories develop new product lines and services for their dentist partners. Modular systems, such as the Planmeca PlanScan digital restorative system, allow that flexibility for growth. You can start with the scan-only module and then easily add into the scan and design system, or go all in to full production milling.

There has been much debate on open versus closed CAD/CAM systems and whether conversion to a digital workflow requires multiple systems. What are your thoughts on this and how can Planmeca address these concerns? Planmeca has always been a great believer in open platforms. Our imaging software operates on any operating system platform that imports and exports DICOM and Twain images and data. We will continue this same philosophy within our CAD/CAM strategy. We encourage the market to have open solutions and develop technologies that communicate with each other.

What is your position on the expanding role of the laboratory as it relates to partnering with dental practices in the implant planning process? Digital impressions as they relate to dental implants, although a small piece of the restorative market, are growing 15% to 17% annually. We expect this trend to increase even more as the population base continues to age. The complexity of implants and the communication bridge that digital impressions provide requires an enhanced service level interface between dentists and dental technicians. Our Planmeca Romexis software platform provides tools that enable the dental team to visualize and share threedimensional files, such as CBCT scan data and implant treatment plans, on one platform. This technology helps laboratories create implant-based restorations faster and better with guidance from oral surgeons. Also, due to increasing regulatory controls, dental laboratories that offer implants and implant abutments are likely to face increased regulatory review. This new level of compliance will require dentists do their due diligence in ensuring that they work with dental laboratories that can attest to having quality systems and good manufacturing practices in place to produce such restorations.

What is your vision on how the dental industry will look in 5 years? CAD/CAM will play an increasingly important role in the dental industry. Digital impressions in combination with 3D imaging will become the standard of care in most practices. The use of combined datasets has opened new avenues that pave the way to new applications and has created new opportunities for digital laboratories. We have only begun to experience the impact of the digital impression and CAD/CAM revolution. I would like to invite you all to challenge the manufacturing community with your future needs to make the dental profession even more exciting.

Tuomas Lokki is the President of E4D Technologies in Richardon, TX., and Vice President of Marketing and Sales Planmeca Oy, Finland.

By Inside Dental Technology
Inside Dental Technology (IDT): Do you believe that CADCAM technology is here to stay in the dental profession? Tuomas Lokki (TL): Absolutely. However, we are at the very beginning of this transformation. There are many new applications on the horizon. CAD/CAM technology is the entry point for many dental offices converting to digital processes and will be one of the primary technologies in the dental arena in the future. Dental laboratories are, in many cases, leaps ahead of the dental office. I see huge growth opportunities for laboratories in terms of complex and specialty cases because they are perfectly poised to offer dentists expert guidance.

Sirona’s international success: Russian clinic buys the 40,000th C8+ treatment center

By Sirona

Salzburg, Austria: Products "Made in Germany" have long been sought after around the world. This is also reflected in the international sales figures for the Sirona C8s. The treatment center combines high quality with timeless design.

The 40,000th C8+ dental center recently rolled off the production line at Sirona in Bensheim, the world’s largest production site in the dental industry – making this unit, which was designed for the global market, even more successful than the classic M1. The milestone unit and three other C8s centers were purchased by the Kremlyovskaya Stomatologia dental clinic in Ryazan, Russia. “We have had very good experience with Sirona equipment. The company’s treatment centers are of a very high quality and are known for their reliability, long functional life, and support features for ergonomic patient positioning that prevent back strain while working,” said clinic director Andrey Archipenko, explaining his decision. “Made in Germany” is always a key quality factor around the world – especially in Eastern European, Latin American, Asian, and Arabian markets. The 50,000th C8+ treatment center was sold to a buyer in China in 2011.

Easy operation and timeless design

Because of the wide range of possible applications, the C8+ units can be found in practices, clinics, and universities in over 100 countries. The sturdy construction and intuitive operation make them ideally suited for ongoing use in clinical practice routine as well as for teaching.

In addition to its top quality, the timeless design of the C8+ gives it the high-end look. Users can choose between various finishes and three color schemes for the upholstery – elegant, natural, and active. Director Archipenko chose a premium decor in trendy orchid that blends seamlessly into his newly refurbished clinic. You can use the online C+ configurator to determine which color scheme best matches your facilities before purchasing. Dentists can design their treatment rooms virtually to get some initial assistance in selecting colors.

Optional features

Dentists can configure the C8+ individually depending on their personal preferences and local conditions. The range of optional features has been continually adapted in response to technical developments and sets new trends. For example, optional features include a brushless motor (BL ISO C), LEDview treatment lamp, and an intraoral camera system. Dentists who want to provide their patients with an especially comfortable atmosphere can also have their C8+ treatment center equipped with the new lounge upholstery, which has a premium cushion design, a soft, elegant feel, and an attractive double-seam look.

Exemplary ergonomics

With its serial ErgoMotion system, Sirona also ensures patients’ comfort and gives the treatment team optimal access to the mouth. At the same time, the individual operating elements are arranged to allow the dentist to work without back strain. The many options, the outstanding workmanship, and the timeless design make the C8+ a treatment center that is still very popular today – 40,000 units sold – with dentists all around the world.
AAID president-elect named vice dean at Harvard School of Dental Medicine

By Dental Tribune America

NEW YORK, USA: After an extensive nationwide search, AAID President-Elect John Da Silva, DMD, MPH, ScM, AFAAID, has been named vice dean at Harvard School of Dental Medicine. Dean Bruce Donoff stated that Da Silva’s “extensive institutional knowledge and experience in [HSDM’s] three focal areas — research, education and patient care — will be of great value as HSDM continues its strategic planning process.”

Da Silva serves on the board of trustees of the American Academy of Implant Dentistry and is currently the president-elect. He is also chair of the Bylaws Committee and serves on the Education Oversight and Nominating committees. He has received widespread recognition during his academic career, including being named an honored fellow of the American Academy of Implant Dentistry and receiving the HSDM Distinguished Junior Faculty Award.

He has published numerous journal articles and lectured nationwide. Da Silva has made major contributions in research and the area of color science. He has also been involved in curricular changes to improve content on substance-abuse screening and brief interventions.

Da Silva was born in New York City and attended Williams College as an undergraduate. He received his dental degree from the Harvard School of Dental Medicine and his MPH degree from the Harvard School of Public Health. He later returned to the School of Public Health and received a ScM in health policy and management.

Da Silva completed specialty training in implant dentistry and prosthodontics at HSDM in 1992. He has been a faculty member there since 1993.
for Hospitals Ltd who were represented by the chairman Mr Elie AbouChedid. CARE are the agents of Planmeca in the Kingdom of Saudi Arabia. Also present at the event was the President of Planmeca Mr Heikki Kyostila and Mrs Kyostila from Finland.

President Riad Bacho gave a brief word and then handed over the presidency medal to President Ali Al-Aheideb.

President Al-Aheideb thanked all those present as well as the event sponsors and praised the work of fellow Yousef Talei; the session’s past vice president, who had done the groundwork for the organization of District 2.

Counselor Cedric Haddad also gave an update of the activities of the International Council and of the changes that were taking place in the College.

Mr Elie AbouChedid then introduced his company (CARE) and gave a presentation of the advanced technical services it provided.

A banquet followed the meeting and gave all those present the chance to socialize, renew acquaintance and exchange ideas.

Fellows in the ceremony from left Abdallah Al-Kradees, Fhad Abdallah, Hanay Onusi, Moustier Silvaoui, guest Dr Youssef Al-Khoudair, Abdalganmi Mina, Yousef Talei and Zaud Salmee.

From left, President Al-Aheideb, Yousef Talei, Riad Bacho, Cedric Haddad, Ibrahim Nasseh, Mrs Kyostila, Mr Heikki Kyostila Mr Elie AbouChedid, and with her back turned, Imtiaz Turkistani.

Planmeca makes CAD/CAM easier than ever

Planmeca’s open-interface-based CAD/CAM solutions introduce, above all, quality, cost-efficiency and precision to the daily workflow at dental clinics or laboratories. Petri Kajander, Product Manager for Planmeca’s CAD/CAM solutions, explains the revolutionary features of these new products.

State-of-the-art solutions for dentists

Planmeca PlanScan – super-fast intraoral scanner

The new Planmeca PlanScan is a digital and powder-free intraoral scanner that scans the patient’s dentition quickly and accurately. The scanner produces real-time digital impressions from one-tooth to full-arch scans. Thanks to the open STL data, the scanned files can be sent to any dental laboratory for design work. This is the world’s first dental unit integrated intraoral scanner that can also be connected to a laptop.

“The scanner has only one cable, so it is extremely easy to move from one place to another, for example between different treatment rooms or clinics”, says Product Manager Petri Kajander. “In addition, the scanner is delivered with a laptop, so the device can be flexibly shared between different users. In other words, Planmeca PlanScan offers value for your investment: it is not a device for just one dentist but can be used by the entire clinic.”

The scanner utilises blue laser technique. It projects a pattern on the surface of the teeth and then analyses it from different directions while calculating distances. In this way, the device is able to calculate a model that is extremely accurate. “You can view the result as a real-time video image. The video recording and the dental surface identification algorithm make the device extremely flexible to use. Thanks to these features, you can pause the scanning at any time and continue later on at any point from where the data is already available.”

The scanner includes a range of exchangeable tips in various sizes, the smallest of these facilitating access to the posterior parts, particularly with small children and trauma patients. The tips can be autoclaved for efficient infection control. In addition, the scanner is extremely durable since it has no other moving parts inside except for a fan that removes warm air. “Thus, the device stays calibrated and is not subject to mechanical wear”, explains Kajander.

Planmeca PlanCAD® Easy – efficient design tool for prosthetics

Planmeca also offers dentists a new kind of open software solution for 3D design. Planmeca PlanCAD® Easy is seamlessly integrated in Planmeca Romexis® software and is a user-friendly design tool for the design of inlays, onlays, veneers, crowns and bridges.

“The software runs on the so-called floating licence basis. This means that it is not tied to just one computer or workstation. Planmeca PlanCAD® Easy can be conveniently paired with any computer in the clinic and can also be connected via the Planmeca Romexis Cloud service. Thanks to the software, work will be continued straight away on another computer, while the scanner is freed for more productive operation”, says Kajander.

Every dentist designing his or her own prosthetic works will also face cases that require assistance from a dental laboratory. For this reason, Planmeca’s system utilises an open STL file format that allows the work to be sent immediately to a partner via the Planmeca Romexis® Cloud service.

Since Planmeca PlanCAD® Easy is integrated in Planmeca Romexis software, soft tissue scans can also be conveniently paired with the patient’s CBCT image. This combined data provides valuable information for im-
VITA VMK Master®
Innovation in the third generation!

The new VITA metal ceramic with the familiar layering you're accustomed to.

The Planmeca PlanCAD Easy workflow from preparation to the finished result includes just five easy stages: work description, scanning, marking of the margin line, automatic design, and sending the work to the mill. “Once the work has been sent to the mill, it is transferred there in its entirety and the mill's computer finishes the work. In this way, the software and scanner are immediately freed for a new assignment.”

The software is very user-friendly. All design phases are saved automatically, and if further impressions are needed, previous phases can be returned to flexibly. The automatic design software automatically takes into account the adjacent teeth's cusps and marginal ridge in addition to the contact strengths defined by the user. This creates a design that always fits its surroundings.

Planmeca PlanMill® 40 – fast and precise milling unit for dental clinics

Planmeca PlanMill® 40 is an extremely precise four-axis milling unit operating under the control of its own computer. The device is suitable for all indications of a single tooth, in other words for the milling of crowns, inlays, onlays and veneers. The mill can manage bridges of up to five units to the posterior and three units to the anterior area.

Since the mill handles the milled pieces completely independently, as many as several dozen pieces can be sent to the mill at a time. In addition, the device tells which block size, colour and material should be used, so any member of the staff can place the block in the mill. “This saves everyone’s working time. The dentist does not need add the block himself, but anyone can do it”, says Kajander.

The mill has a six-tool exchange mechanism, and it changes tools independently according to different job requirements. In addition, the device mills different materials according to their properties. For example, it knows how to gently handle delicate ceramics in work phases that require precision. “If you force the material, it may break prematurely. Even the smallest hairline crack in the material can lead to a cemented piece breaking when...”
Interview: “Kennedy’s wound was clearly incompatible with life”

By Dental Tribune International

F ew people are granted the opportunity to become an active part of historical events. Seventy-six-year-old Dr. Don T. Curtis, a former dentist from Amarillo in Texas, is one of them. As a surgical technician in oral and maxillofacial surgery at Parkland Memorial Hospital in Dallas, he was one of the first doctors to have performed emergency treatment on U.S. President John F. Kennedy after he was shot on 22 November 1963. Dental Tribune ONLINE had the opportunity to speak with him about that day and the reason he thinks that there was more to the assassination than a lone gunman.

Were you aware of the president being in Dallas on 22 November 1963?

I was not aware of that and was surprised when they brought him to the hospital. I had a surgery scheduled for later that day and was on my way to have lunch. The trauma room was also never required to leave the building and walk across the receiving area of the emergency room, where I noticed police cars and the president being in Dallas on 22 November?

What was your position at that time, I was half way my way to have lunch. The trauma room was also never required to leave the building and walk across the receiving area of the emergency room, where I noticed police cars and the president being in Dallas on 22 November?

What was the atmosphere in the room?

It became very quiet. Nobody said anything.

In your opinion, was there any chance that the president’s life could have been saved?

Nothing that we did made a difference. Kennedy’s wound was clearly incompatible with life.

According to eyewitnesses, discussions broke out about who was authorized to do the autopsy. Did you notice any of that?

I did not because I left the trauma room soon after the president had been pronounced dead and went back to the clinic to see my patient in the operating room. However, I found that all scheduled surgeries for that day had been canceled and all patients had been sent back to the ward. Only a few surgeries were underway at that time, including that of Governor John Bowden Connally, who had also been injured during the shooting.

“We learned that the suspect, Lee Harvey Oswald, had been shot, which indicated that there was something going on in addition to just alone shooter.”

When I looked up later, the room was filled with the senior chiefs of all surgical departments at Parkland. There were also some people I did not know.

When a policeman asked me whether I was a doctor, I said yes. He then replied that the president was hurt and escorted me to the trauma room where President Kennedy was.

In what condition was Kennedy when you arrived?

I could not because I left the trauma room soon after the president had been pronounced dead and went back to the clinic to see my patient in the operating room. However, I found that all scheduled surgeries for that day had been canceled and all patients had been sent back to the ward. Only a few surgeries were underway at that time, including that of Governor John Bowden Connally, who had also been injured during the shooting.

“I told my patient that her surgery had been postponed. She understood that. Since there was nothing else for me to do, I then cleared my business and went home. There, we spent the weekend watching television and listening to the news on the radio. We were relieved that President Lyndon B. Johnson had made it safely to Washington and that the government was uninterrupted.

Finally on Sunday, we learned that the suspect, Lee Harvey Oswald, had been shot, which indicated that there was something going on in addition to just alone shooter.

The majority of Americans do not believe that Oswald acted alone by hitting Kennedy with three shots in the back, as concluded by the report of the Warren Commission appointed by the government to investigate the circumstances of the assassination. Did you observe any irregularities between this official version and the events you witnessed?

The Warren Commission’s report reflected what the people wanted to hear, which was that Oswald acted alone and that there was no conspiracy. The doctors of Parkland however when wiping the blood from Kennedy’s neck for the tracheostomy found a single bullet hole that was apparently an entrance wound which meant that must have been a projectile that entered the president from the front. Because of its nature, another wound on the back of Kennedy’s head was an exit wound, so there must have been at least two bullets that came through the front.

While all the doctors’ testimonies, including mine, were given, the report based on knowledge of the wounds did not have much influence on the Commission’s overall conclusion. Why it was interpreted that way has remained a mystery for the past 50 years.

What do you believe actually happened that day?

My personal belief is that there were of course multiple shooters and that Oswald did not do it alone. This would indicate however that there was in fact a conspiracy.

After the events, you stayed at Parkland Memorial Hospital for another two years. Were the events still discussed by the staff in the aftermath?

We actually never talked about it. This was something we just did not want to discuss. However, I left Parkland in 1965 for an exchange residency in London and Zurich, where I often discussed the events with my colleagues abroad. Particularly in England, there was much interest in U.S. politics and the assassination.

You recently went public with your knowledge after 50 years. What were your reasons for doing so?

Everything that I would say is already in the literature about the assassination but I think there needs to be general knowledge of what people who were actually involved knew.

More than six million pages of classified evidence on the Kennedy assassination are going to be released by 2017. Are you interested in this knowledge, or do you consider that chapter of your life closed?

There is a great deal of speculation of what information these documents actually contain. I do not look forward to it but would be interested to know what could be learned from them.

Thank you very much for the interview.

(DTE/Photo courtesy of Baylor College of Dentistry, USA) — Right: US Secret Service agents and local police examine the presidential limousine outside of Parkland Memorial Hospital in Dallas, Texas, as President John F. Kennedy is treated inside the hospital after being shot. (DTE/Photo courtesy of John F. Kennedy Presidential Library and Museum, USA)
Fig. 3  

The dental laboratory’s primary role in restorative dentistry is to laboratory copy all of the functional and aesthetic parameters that have been defined by the dentist into a restorative solution. Throughout the entire restorative process, from the initial patient consultation, diagnosis and treatment planning to final restoration placement, the communication routes between the dentist and the laboratory technician require a complete transfer of information. Functional components, occlusal parameters, pho netics and aesthetic requirements are just some of the essential types of information that are necessary for the technician to completely fabricate a successful, functional and aesthetic restoration. Today, as in the past, the communication tools between the dentist and the technician are photography, written documentation and impressions of the patient’s existing dentition. The clinical models from these impressions are created and mounted on an articulator that simulates the jaw movements of the mandible (Fig. 2).

The digital laboratory  
As restorative dentistry evolves into the digital world of image capture, computer design and the creation of dental restorations through robotics, the dental laboratory must evolve as well. To fully understand this concept, a laboratory must be clearly defined.

At first thought, it may seem that a laboratory is the place where a dentist sends his or her patient’s impressions to (Fig. 5) be processed into restorations, which are sent back to the dentist for adjustment and delivery. This definition fits well with the traditional concept of a laboratory/dentist workflow. However, just as the Internet has forever changed the landscape of communication through related computer technology, the possibility to use CAD/CAM restorative design—with the addition of the latest developments in intra-oral laser scanning, materials and computer milling/printing technology—will only enhance the close cooperation and working relationship of the dentist/dental laboratory team (Fig. 1).

The current laboratory fabrica-
tion process follows a very linear progression: model fabrication, day one; waxing, day two; finishing, day three; ceramics, day four, etc. Average production time for an all-ceramic or porcelain-fused-to-metal restoration is approximately five to seven working days based on this fabrication method.

In the digital laboratory, impressions will still be received from the patient. Instead of taking days or weeks to go through several processes, we will be able to accomplish the same process in two to three days. Once the impression is received at the laboratory, the impression can be scanned and data sent to several digital production stations at the same time. This will potentially allow the model, the restorations (both framework and waxup) and the final ceramic restoration to be completed at the same time (Fig. 6).

Digital diagnostic and treatment planning The basis for all long-term success in restorative dentistry is a comprehensive diagnosis and treatment plan. The ability to preview a case from start to finish, communicate and co-diagnose with other specialists and specialties about dental patients via the virtual world is the true power and capability of digital dentistry.
Sirona Group receives another Top Employer Award

By Sirona

SALZBURG, Austria: Since receiving the Top Employer Awards for Germany, Austria and Engineers in 2015, Sirona’s excellent human resources policy and very good working conditions have also earned it international recognition in 2014. In an award ceremony in Shanghai, Sirona China was given the “Top Employer China 2014” award in mid-January. The company’s German employees have also been successful at the Chinese site.

In a multi-phase analysis and auditing process, the Top Employer Institute (formerly CRF Institute) designates outstanding employers around the world every year. Some of the key criteria include excellent working conditions, promoting talent, and continuous development of human resource management. Sirona China was given the highest award “Top Employer China 2014” along with 40 other employers. Michael Elling, Vice President Corporate Human Resources of the Sirona Group, expressed his satisfaction: “Our employees are the heart of our company. The Top Employer Award for Sirona China is an acknowledgment of our local and global efforts to support our employees. It is part of our global growth strategy, it increases our attractiveness as employers, and it motivates our employees to work at Sirona in Germany and abroad.”

Growth and development at Sirona China

In 2006, Sirona began to develop the business in China with just 30 employees. Today, eight years later, there are more than 150 employees here – a success story, also with respect to personnel development. “Employee satisfaction is the basis of our success at Sirona China. This is why we find it important to have an excellent team, promote team spirit, and motivate continuing development among our employees. It is rewarding to see how many employees successfully climb the career ladder,” explains Henning Müller, Vice President China and South East Asia. A strong growth that is reflected in the market, Sirona China is the number one company for dental treatment chairs. Digital dentistry and CAD/CAM products have also made significant gains in the past two years.

Employee success stories

Sirona offers many opportunities and promotes young talent among students as well. For example, the German student Verena Schüttler spent four months at Sirona in Asia during her International Business studies at Baden-Württemberg Cooperative State University. There she became familiar with the international team and the Shanghai location, and she helped develop the Singapore office, which was opened in November 2015. A career opportunity open to all employees at Sirona fostered by the Talent Excellence Program encompasses individual advanced training, project assignments across positions and locations, and targeted international cooperation and career advancement in one of its worldwide subsidiaries.

So saliva collected at a constant flow rate for 2 minutes will have a different composition from saliva collected at the same flow rate for 10-15 minutes.

Nature of the stimulus – Different stimuli have an effect on salivary composition, mainly because of their effect on the rate of flow. Acid is the most potent stimulus for the rate of flow. Acid is mainly because of their effect on salivary composition, Different stimuli have an effect on salivary composition.

The buffering ability of saliva Bicarbonate is the most important buffering system in saliva but only at high flow rates, when it is an important buffer against acid produced by dental plaque. Its concentration varies from less than 1 mmol/l in unstimulated parotid saliva to almost 60 mmol/l at very high flow rates, with whole saliva elicited by chewing gum having a bicarbonate concentration of about 15 mmol/l. Thus, in unstimulated saliva, the level of bicarbonate ions is too low to be an effective buffer.

Additionally, salivary pH is dependent on the bicarbonate concentration, an increase in which results in an increase in pH. At very low flow rates, the pH of parotid saliva can be as low as 5.5, rising to 7.8 at very high flow rates. Individuals with hyposalivation will thus have a low salivary pH and a low salivary buffering capacity because of the low bicarbonate concentration.

Conclusion
Saliva not only plays a pivotal role in the maintenance of a healthy homoeostatic condition in the oral cavity, but contributes to one’s overall health and wellbeing. Components from saliva interact in different ways with the dentition to protect the teeth. Patients who lack sufficient saliva suffer from many oral diseases, of which caries is only one. To alleviate discomfort they are advised to use saliva stimulants and substitutes which have the function of lubricating the oral surfaces. Chewing gum is increasingly being viewed as a delivery system for active agents that could potentially provide direct oral care benefits, as it promotes a strong flow of stimulated saliva.

The fourth edition of Saliva and Oral Health is available in hard copy or e-book format and Oral Health is available in the world, including North America, Latin America, Europe, the Middle East, and the Asia Pacific region.

Danaher also stated that each company will continue to market itself under its current brand to local customers and individual markets.

According to Matt Garrett, vice president of marketing for KaVo Kerr Group, it will be presenting 20 new products in celebration of its formation at this year’s Chicago Dental Society Midwinter Meeting, which is being held until tomorrow.
Biological and conservative root canal instrumentation with BT-Race file system

By Drs Gilberto Debelian & Martin Trope

Root canal instrumentation is one of the major tools for ensuring the long-term success of root canal therapy. The aim is to mechanically disrupt as much biofilm as possible so that with the addition of irrigants and/or intra-canal medicaments a very low microbial count can consistently be achieved before the filling of the root canal. Another aim or challenge of root canal instrumentation is to achieve the microbial reduction goals mentioned above without unnecessarily weakening the root by over-instrumentation, for example through the reduction of the dentinal wall thickness. Preservation of native structure, especially in the cervical region of the tooth has been demonstrated to correspond to better long-term survivability from a loading and restorative standpoint. It is well established that as the remaining dentine thickness decreases so does the root’s resistance to fracture.1

In evaluating anatomical studies, it is striking that they are consistent. Figure 1 best summarises the anatomical aims for a mandibular molar. The mesio-lingual canal, a size 35 would appear adequate on the radiograph (mesio-distal view) but the correct size would be 50. In order to achieve the goals mentioned above, we should aim for 50, 40 or 30 apical sizes with no more than a 0.04 taper.2 These biological sizes with the addition of an adequate irrigation protocol will ensure a consistently low microbial count for maximal success.

**BT-Race system**

BT-Race files (FKG Dentaire) are sterilised in individual blisters so that sterility is maintained for every file. The biological sizes mentioned above can be achieved with three files every time once a glide path has been established. The system was designed in such a way that these sizes are attained with minimal removal of dentine coronally to maintain the strength of the root. Moreover, the Race file has a non-screw-in design and triangular cross-section to increase flexibility and cutting efficiency. It is also electropolished to decrease the effects of torsional and cyclic fatigue (Fig. 2).

The Booster Tip (BT, Fig. 3) is the key feature of these files however. It allows them to follow the key feature of these files so that with the addition of an adequate irrigation protocol will ensure a consistently low microbial count for maximal success.
The BT starts as a non-cutting tip from 0–0.15mm diameter and the cutting edges start from 0.15mm and upwards on the file (Fig. 4). Essential steps for the successful use of the BT-Race sequence are the following:

Glide path
In order to guarantee a minimal number of file breakages, a glide path to size 15.02 is essential. Hand files can usually achieve this aim. However, if a 6 or 10 file is extremely difficult to take to working length, ScoutRace files allow one to achieve this requirement more quickly.

Speed of 800–1,000 rpm
A high speed reduces the risk of breakage due to torsional fatigue. As these files are for use with individual patients only, the possibility of breakage from cyclic fatigue is also reduced.

BT1 (10.06 file)
This file (Fig. 5) establishes the final glide path and determines the coronal diameter. In any canal in which a 15.02 glide path has been established, the file will contact mainly the coronal third of the canal. At 12mm from the working length, the diameter will be 0.82mm. These files have no BT, since the tip diameter is already 0.10mm and smaller than the glide path established with a 15.02 K-file.

BT2 (parallel 35 file with BT)
The BT2 file (Fig. 5) is used to prepare the apical third of the canal. It is extremely flexible owing to its non-tapered design, yet penetrates into the narrow canal easily and efficiently with the BT.

BT3 (35.04 file with BT)
This file (Fig. 5) is used to join the coronal and apical preparations created by the BT1 and BT2 files and thus create a 35.04 final shape that allows maximal irrigation and a tight cone fit. The file is able to go to working length with minimal stress, since the coronal third has been cleared with the BT1 file and the apical third with the BT2 file. Importantly in this canal, the maximum diameter at the 12 mm level is 0.85 mm. Consequently, the removal of coronal dentine is minimal, allowing for the strongest root possible after restoration.

BT-Race xL: BT 40 (40.04 file) and BT 50 (50.04 file), 600–800 rpm
These two instruments (Fig. 6) enable finishes at ISO 40 and 50 when adequate apical sizes require larger sizes. If even larger apical preparations than ISO 50 are required, the Race range of instruments is recommended in the required sizes, preferably with a small taper of 0.02. With this unique file system, all canals can be conservatively instrumented to the correct biological sizes while maintaining maximum cervical tooth structure.

The BT ensures that the original canal shape is maintained, thus keeping even the larger files centred in the canal. Through this advantage, in addition to the minimal taper required to achieve these biological sizes, the canal is maximally cleaned without weakening or stressing the root.

KaVo Dental GmbH: Success at AEEDC

By KAVO

DUBAI, UAE: For 3 consecutive days, KaVo Dental GmbH MEA took part in the 18th Edition of AEEDC Dubai 2014. We displayed a brand new Patient simulator for Universities that will be launched in spring 2014 as well as the complete range of ESTETICA treatment units. Guests were also invited to gain valuable hands-on experience with the new Leica M520 microscope with full HD integrated camera with Mrs. Natalia Lebedeva, Commercial Manager for Leica Microscopes.

And to further demonstrate the high tech product range of KaVo, the CAD/CAM systems, Arctica and Everest were also showcased by our product manager, Mr. Mohamad Abdallah, KaVo Dental GmbH Middle East & Africa.

We also hosted several exciting lectures with Dr. Heinz-Theo Laebbers, head of the Dental Radiology Dpt. of the University of Zurich; who enlightened us about CBCT technology. As part of our dental imaging portfolio, we showcased the Gendex GXDP-700 3D machine with Pan + Ceph, Pan + 3D, and Pan + Ceph + 3D, options that make it suitable for any dental imaging purpose.

In addition, Dr. Thorsten Wegner from Germany introduced the DIAGNOcam for modern carries detection without X-ray, which has recently received an innovation award from the German magazine “ZahnarztWoche” and Pluradent.

The stand attracted the attention of a diverse crowd of professionals in the dental industry and it was a pleasure for us to meet all of them.

**Helps stop bleeding gums**

Adapted from Saxer et al 1991. All interdental spaces from 6 to 6 were tested at baseline and 4 weeks for bleeding on probing on the right side (buccal) and left side (lingual). Findings were recorded as 0=no bleeding; 1=slight isolated bleeding; 2=marked bleeding. Mean scores were determined. N=22.

Baseline values (Mean SD): Control (fluoride-containing toothpaste) group 24.75 (6.34); parodontax® group 25.40 (5.80). After 4 weeks: Control (fluoride-containing toothpaste) group 26.00 (7.14); parodontax® group 19.80 (7.38). *parodontax® vs control p<0.05.
Modern life can be challenging.

Modern, healthy lifestyles and dietary habits often mean an increase in the consumption of acid-rich foods and drinks. However, experts believe that as few as 4 acidic challenges a day can put patients at risk of Acid Wear. In addition to giving behavioural advice (e.g., diet and brushing), your patients may also benefit from a daily toothpaste that can protect enamel from these multiple acid challenges.

Pronamel is proven to reharden acid-softened enamel and provide ongoing protection from the effects of Acid Wear.

Daily protection from the effects of Acid Wear.
