By Dental Tribune Siena

CEREC satisfies an impressive scope of clinical demands. And now patients can benefit from its full-contour zirconia restoration within one session. Zirconia is known for its tremendous strength and biocompatibility, which offers various clinical workflow advantages for practitioners. Dental professionals can use CEREC to bring their knowledge to the next level. This lightweight, computer-aided system offers a high degree of precision, as the outcome is not limited by the patient’s oral situation.

Bensheim/Salzburg: For more than 30 years, CEREC has been offering patients a functional and aesthetic dental restoration with the highest quality standards. The following hand-on courses will be available in Dubai between 01-07 November 2016 at Jumeirah Beach Hotel, Dubai Dental Week. The courses are aimed at dental professionals who wish to expand their knowledge to the next level. All courses are free for participants, and all interested participants are requested to contact CAPP Events to reserve their place.

"Since the zirconia blocks are presintered, the material is circa 25 percent larger than in the final, full sintered state."

How does full contour zirconia behave in terms of accuracy of fit? Very positively. Since the zirconia blocks are presintered, the material is circa 25 percent larger than in the final, full sintered state. Because the finisher 10 milling instrument is relatively smaller than normal grinding burrs, the margins, lumen and occlusal are all milled with the greatest detail. And, since there is no facing on a metal framework there are no overcontoured margins. Overall we see superb fit coming from full contour zirconia restorations and we’re excited to bring these benefits to dental professionals.
