People who follow a Mediterranean diet combined with exercise, not smoking and keeping to a healthy weight could live up to 15 years longer, researchers have said.

The effect is strongest in women, who can live an extra 15 years compared to the least healthy people, while healthy men can enjoy eight years more.

Researchers from Maastricht University in the Netherlands said keeping to the four healthy lifestyle factors can “substantially reduce” the risk of an early death.

A Mediterranean diet is high in vegetables, olive oil, fruit, nuts, fish and whole grains, and low in meat and alcohol.

Researchers found that combining the diet with exercise, keeping to a healthy weight and not smoking dramatically cut the risk of dying young.

Piet van den Brandt, professor of epidemiology at Maastricht University, who worked on the study, said: “Very few research studies worldwide have analysed the relationship between a combination of lifestyle factors and mortality in this way. This study shows that a healthy lifestyle can lead to significant health benefits.

“Furthermore, the effects of a Mediterranean diet were more evident in women than in men. Within this diet, nuts, vegetables and alcohol intake had the biggest impact on lower mortality rates.”

Writing in the American Journal of Clinical Nutrition, researchers looked at 120,000 men and women who were aged 55 to 69 in 1986.

They calculated a “healthy lifestyle score” based on smoking, exercise, weight and diet and followed the group until 1996.

The effect is strongest in women, who can live an extra 15 years compared to the least healthy people, while healthy men can enjoy eight years more.

ABU DHABI: Dental decay is a problem that 16,505 of the 25,778 (64 per cent) capital students suffer from, a recent survey has revealed.

The Ambulatory Healthcare Services (AHS) - SEHA, in cooperation with the Abu Dhabi Education Council (ADEC), carried out a campaign in public schools in Abu Dhabi, testing students from grade 1, grade 5, and grade nine.

The comprehensive preventive examination for students included a clinical test for BMI, CBC, vision, hearing, scoliosis and dental/oral health.

Discussing key oral hygiene aspects, Dr. N. Serah George pointed out, "You would be surprised to know that in some families the toothbrush is shared among the family members. This should be a complete no-no."

"Once in every three months people should also change their toothbrush. However, in case the person has suffered from a fever, it should be changed right after they get better and have completed the medication course."

According to her, adults should change their toothbrush every three to four months while children may need to get new toothbrushes more frequently.

"The toothbrush should be replaced when the bristles show signs of wear. It is important to change it often because it holds within its bristles food particles which were once in your teeth," she added.

Dr. George noted that children should be taught at a young age the importance of brushing their teeth after meals. "Oral hygiene remains a significant health challenge, which needs to be taken seriously by both care providers and patients."

"Brushing twice per day remains a challenge. Inadequate time spent on brushing and lack of knowledge on the appropriate brushing and flossing process further results in failure to reach remote areas around the posterior teeth."

After the health exams have been carried out, plans are being developed to include students from all levels in both public and private schools in the campaign, based on the criteria determined by the Health Authority - Abu Dhabi.

A study has also been carried out to introduce the electronic health files in public school clinics, tying the school clinics to the Seha network. This step will provide the school nurse with access to the latest updates regarding the student’s medical issues, tests, and results.
Abu Dhabi, UAE: With weekly TV programmes in the Middle East showing dentists giving people the pearly-whites of their dreams, and newspapers touting the latest procedure to give you a ‘new smile in an hour’, the attraction of a quick-fix cosmetic smile makeover such as dental veneers, rather than prolonged improvement through natural alignment, can seem a very attractive option for many busy professionals. But, as Dr Raj Kumar, founder of Forma and speaker at Dentistry Middle East 2011 explains, the worrying trend for unnecessary cosmetic dental veneers, carried out on healthy teeth for the sake of a smile makeover, can do more harm than good.

“Traditionally veneers have represented one of the best cosmetic dentistry options for people wanting whiter teeth or who want to camouflage spaces between ‘gappy’ or overcrowded teeth,” says Dr Kumar. “However, having veneers on your teeth is a permanent solution and the veneers will need to be replaced after a period of time.

“Some dentists routinely remove at least 1.5 mm of the outer enamel to create space for veneers. This can lead to a number of complications such as pulpitis, tooth fracture, veneer failure due to the loss of the enamel surface, gingivitis or gingival recession. Once you trim down a tooth you reduce its life expectancy. As we only have one set of adult teeth, why should we rush into irreversible treatment?”

Instead, Dr Kumar recommends the patient does their homework before opting for veneers and considers the less-invasive options available in today’s market. Treatment such as Invisalign, for example, straighten teeth without the need for metal braces or tooth extraction using instead a series of clear, plastic ‘aligners’ which slowly move teeth over time using individual virtual 3D treatment.

“While the total treatment time with this less invasive method of achieving a ‘Hollywood smile’ can take from nine to 15 months, ultimately this treatment is more comfortable and the patient will avoid causing irreplaceable damage to their teeth,” explains Dr Kumar. “To recreate that ‘Hollywood smile’, at the end of the treatment the teeth can be safely whitened if the patient so desires.”

Dr Kumar also advises to watch out for unqualified dentists. “It is very difficult to know how good your dentist really is as anyone can print a certificate. Sometimes a good measure is to see if the dentist can spot the patients’ cosmetic problem without being shown it. This shows that the dentist has experience and is looking at details when carrying out an examination. The best thing is to be shown before and after cases that the dentist has carried out.”

Dr Raj Kumar will be speaking at the 3rd Dentistry Middle East Exhibition and Conference, the Middle East’s largest gathering of dental professionals, which will run from 1-3 November, 2011, at the Abu Dhabi National Exhibition Centre (ADNEC), with more than 50 leading experts in the field of dentistry highlighting the educational significance of the event.

Prof Dr Asmat Lone, Chairman of the Advisory Board for Dentistry Middle East 2011, says: “Cosmetic dentistry is becoming extremely popular in the Middle East as the middle and upper class want their smiles to look perfect. Missing teeth are also becoming a major problem in the Middle East as people are losing teeth due to decay and trauma. The teeth have to be replaced and implantology is becoming the first choice.”
International Team for Implantology awards André Schroeder Research Prize

From news report

BASEL, Switzerland: The International Team for Implantology (ITI) has awarded Dr Nikola Saulacic, dentist, oral surgeon and researcher at the University of Bern, Switzerland, with the 16th André Schroeder Research Prize. Mid-June, Prof. Daniel Buser, president of the academic organisation dedicated to the promotion of evidence-based education and research in the field of implant dentistry, presented the prize at the ITI Congress Benelux in Amsterdam in the Netherlands.

Forty-two-year-old Saulacic was selected by the ITI Research Committee through an anonymous evaluation process. The committee honoured the researcher for his experimental study on “Bone apposition to a titanium-zirconium alloy implant surface” which is aimed at determining the early healing events of titanium-zirconium (TiZr) implants in comparison with titanium implants, both with a modified sandblasted and acid etched (SLActive) surface, and an implant material with additional strength (Ti6Al4V). The study concluded that TiZr implants showed comparably fast early osseointegration than titanium implants supporting their use for more challenging clinical situations in which implants with a reduced diameter are indicated.

The André Schroeder Research Prize was established almost 20 years ago and is presented annually in honour of the late Prof. André Schroeder (1918–2004), founding ITI President, who pioneered implant dentistry and whose life-work contributed significantly to modern dentistry. It is worth CHF 20,000 (US$24,000) in cash. According to the ITI, it is one of the most prestigious awards in implant dentistry.

US scientists measure dino blood

Daniel Zimmermann

NEW YORK, USA: New findings using dinosaur teeth could help to explain how the reptiles were able to regulate their body temperature, researchers from the California Institute of Technology in the US have reported. By measuring subatomic particle concentrations in fossil teeth in two of the largest dinosaur species, they claim to have found that the animals’ body temperatures were much higher than that of other reptiles and comparable to mammals.

Since the first species was officially classified, anthropologists have quarrelled over whether dinosaurs were cold- or warm-blooded. The latest research suggests that they were warmer than originally expected and probably able to reduce body heat through special physiological features. Scientists, however, were not able to determine the body temperature of the creatures except through indirect methods, such as measuring the spacing of dinosaur tracks.

The new approach developed by geochemist Robert Eagle and geologist Prof. John Eiler is able to determine body temperature to within one or two degrees, the researchers say. It measures the concentration of rare carbon and oxygen particles that clump and form minerals called bioapatites, a process that is dependent on heat. The researchers analysed the clumps in 11 teeth of the Brachiosaurus brancai and Camarasaurus species found in different locations in the US and Tanzania.

“Nobody has used this approach to look at dinosaur body temperatures before so our study provides a completely different angle on the long-standing debate about dinosaur physiology,” Eagle commented. He and Prof. Eiler announced that they would be applying the method to other dinosaurs and extinct animals, including mammals, in order to find out more about how they evolved.
Daniel Zimmermann

NEW YORK, USA: Design and Engineering students from Purdue University in West Lafayette in the US have developed a new kind of portable medical chair that can also be used for dental treatment. The device, named the Manis owing to its ability to transform into various shapes, does not have any gears or motors and can be folded into a dolly to suit different medical uses. It is intended to help carry out treatment in underdeveloped countries, where operating traditional surgical equipment can be difficult.

The idea came from Industrial Design student Leha Kenttämää-Squires following several visits to a dental office. In order to realise her concept, she teamed up with Mechanical Engineering graduate Kyle Amick, who helped to build the first prototype. According to Kenttämää-Squires, the Manis is extremely lightweight for carrying by commercial airliners and can store additional medical and dental equipment.

The students are currently seeking to license and commercialise the chair through the Purdue Research Foundations Office of Technology Commercialization, an office that protects and promotes the university's intellectual property. Kenttämää-Squires said that once patented the chair could be available to dental professionals worldwide within two years.

European doctors use Wikipedia and Co.

From news report

LONDON, UK: Sixty per cent of European doctors use the online encyclopaedia Wikipedia for professional purposes, a report has revealed. Furthermore, 69% use social media sites like Facebook, LinkedIn, YouTube and Twitter. For the survey, 300 general practitioners across Europe were interviewed.

The findings show that it is not only young doctors who use the Internet for this purpose. Across all markets, 75% of doctors in the 51 to 60 age groups stated that they regularly consulted Wikipedia for professional use.

According to the London-based Insight Research Group, who carried out the survey, the new statistic surprised many in the industry. Not only did the doctors surveyed use the Internet as a source for their research, but half of them also recommended specific websites for their patients to visit following their consultations. Eighty-seven per cent advised certain sites for further background or education on their condition, 70% for additional support and advice, and 69% for more information regarding treatment and medication.

According to the Insight Research Group, the findings reinforce the popular view that we are now living in the era of the “e-patient”, for whom the web has become a trusted tool for health-related matters, as well as daily tasks.

“The e-patient is here to stay. But we have to investigate whether patients are accessing the right type of websites when it comes to health issues they or their loved ones are facing,” continued Damian Eade, Director of Insight Research Group.

“Whether it’s researching illnesses, sharing experiences, making recommendations or providing moral support for other patients around the world, the social web has reinvented health advice.”
Two-stage esthetic crown lengthening

By Michael Sonick, DMD, Stephen Rothenberg, DMD and Debby Hwang, DMD

A smile that is perceived as unattractive mars confidence, socialization and self-regard. For some patients, the lack of visual appeal stems in large part from a “gummy smile,” which a layperson begins to consider disharmonious when there is 5 to 7 mm of gingiva displayed.1 Management of such a complaint often entails both periodontal and restorative therapy, if not also orthognathic surgery and facial plastic procedures.

The following report showcases two-stage esthetic crown lengthening and esthetic recontouring for the treatment of a gummy smile.

Patient history
A medically and periodontally stable 40-year-old female presented with excessive, asymmetric gingival display of 5 to 7 mm upon smiling, short clinical crowns and incisal wear from tooth #4 to #15 (Figs. 1, 2).

Due to attrition and the relationship between the dentition and periodontal shape, the anterior teeth appear square-shaped and “masculine.”

Diagnoses included (1) Coslet Type IA altered passive eruption, evidenced by a wider-than-cus- tomarium dimension of keratinized gingiva and an alveolar crest at least 1.5 mm apical to the cemento-enameled junction (CEJ); and (2) vertical maxillary excess.2,3 The patient also exhibits a thick tissue biotype.

Access to tooth #4 to #13 (Figs. 1, 2).

Coslet Type IA altered passive eruption, evidenced by a wider-than- cus- tomarium dimension of keratinized gingiva and an alveolar crest at least 1.5 mm apical to the cemento-enameled junction (CEJ); and (2) vertical maxillary excess.2,3 The patient also exhibits a thick tissue biotype.

Excessive keratinized gingiva, a thick soft tissue biotype and asymmetric gingival contours exist.

Restorative consult

From the diagnostic models, the patient’s prosthodontist created an ideal denal wax-up, upon which a vacuum matrix was applied to generate a surgical guide (Figs. 3, 4).

Osteotomy was performed using an Ochsenbein chisel, carbide finishing bur and Neumeyer bur to position the alveolar crest at least 5 mm from the anticipated restorative margins at each site, as verified by the surgical guide (Fig. 6).

The bone was grafted such that no sharp edges or bony areas existed, and positive archi- tecture was preserved. The flaps were replaced and sutured in ling fashion with 4-0 expanded polytetrafluoroethylene (ePTFE) (Fig. 5). The gingival height and shape post-surgery appeared similar to that found before surgery, even 10 days after intervention (Fig. 8).

Gingivectomy (second stage)

Once the soft tissue resected six weeks post-osteotomy (Fig. 9), the second stage of biphasic crown lengthening of teeth #4 through #15 was executed. The patient was sedated and anesthetized as above.

A definitive external bevel gingivectomy of teeth #4 through #15 was performed with a #15 scalpel utili-
Dental Tribune Middle East & Africa in collaboration with CAPP introduce to the market the new project mCME - Self Instruction Program. mCME gives you the opportunity to have a quick and easy way to meet your continuing education needs.

After submission of the answers, (name and membership number must be included for processing) they will receive a Certificate with unique ID Number within 48 to 72 hours.

Articles and Questionnaires will be available in the website after the publication.
Moving the dental world from analogue to digital: 3Shape’s success story continues

Bernhard M oldenhauer & Matthias D iessner

During SCANDEFA, a major dental fair in Scandinavia, DTI recently visited the 3Shape headquarters in the heart of downtown Copenhagen to learn about the company’s new products and future strategies. The historical building along-side Kongens Nytorv square and the Royal Danish Theatre has light and airy rooms, a perfect environment for a young, passionate and ambitious organisation driven to develop the best technological solutions in 3-D scanning and CAD/CAM.

Often referred to as the “Google of the Dental Industry”, 3Shape was launched eleven years ago in a one-room apartment by two young and ambitious graduate students from the Technical University of Denmark and Copenhagen Business School—Tais Clausen and Nikolaj Deichmann. At the time, Clausen was completing his master’s thesis on a groundbreaking 3-D scanning technology and Deichmann was finalising his Master’s degree in Finance and Economics. Having met through friends, they joined forces to participate in the prestigious Venture Cup business plan competition, established by McKinsey and Co., in which they finished second. Throughout the competition, they constantly considered the manner in which the technology could be commercialised and thus the idea of launching 3Shape was born.

Initially, Clausen and Deichmann approached companies in the hearing-aid industry with the idea of developing a quality-control system for hearing-aid shells and ear moulds. Similar to a dental restoration, the devices need to be custom fitted to the patient’s hearing canal and are traditionally made by taking an ear impression that is then manually sculpted, cut and used to make a mould—a time-consuming, manual procedure.

“During these first meetings, we realised that we could actually create a mass customisation production system,” Deichmann remembered. “So instead of just checking the quality we decided to go directly for changing the workflow completely, from a manual process, where you spend several hours shaping the hearing-aid shells, to a completely digital workflow.”

3Shape digitised the entire manufacturing process by introducing a 3-D scanner for ear impression taking, as well as the management software and CAD software needed to simulate the position of all the electronic components that need to fit into the patient’s ear along with the shell, taking up minimal space and using CAM software for controlling the manufacturing equipment.

They developed the system for a specific hearing-aid manufacturer but retained the rights to sell the technology to others.

At the time, there were only six companies that controlled approximately 90% of the global hearing-aid market and within a period of three years, all of them went from a completely manual to an entirely digital production. Today, about 90% of all hearing-aid devices are produced using 3Shape’s technology.

Clausen and Deichmann were always aware of the 3-D scanning technology’s enormous potential so they soon looked to other industries where the manufacturing processes are similar to the hearing-aid indus-
try, such as dental laboratories. In 2004, 3Shape began to receive an increasing number of requests from dental companies interested in the technology.

“We quickly decided that if we wanted to replace our success in the hearing-aid industry, we needed to go for the full solution to have a very user-friendly system that the dental laboratories would adopt. Therefore, we went to a lot of laboratories, small ones and big ones, and tried to figure out how we could optimise the processes instead of just finding a better way to make zirconia copings. From the very beginning, our vision was to achieve a complete switch from analogue to digital,” Deichmann explained.

3Shape introduced its first 3-D dental scanner and CAD/CAM software for virtual restoration design at the International Dental Trade Show (IDS) in Cologne in 2005 and the system became a raving success. In the following years, the company extended and enhanced their dental laboratory product range by continuously responding to and involving their customers from the early stages of the product development process.

“When the most important lesson we have learned is that innovation is only successful if it moves and is guided in directions that truly benefit professionals in their daily work,” Clausen, CTO and head of the 3Shape development team, pointed out.

Today, CAD/CAM has conquered dental laboratories and clinics, ensuring high profitability by maintaining top-level quality through standardised and controlled treatment and production processes that also benefit the patient. In Germany, traditionally an early adopter of new technologies, approximately 82% of all ceramic restorations are already produced using CAD/CAM technology. “The question today is no longer if CAD/CAM will endure in the industry, but rather when all dental professionals will be taking advantage of it,” Clausen said.

After having conquered the dental laboratory industry, 3Shape also extended the proven technological benefits to dental clinics.

“We analysed all existing scanning systems on the market and defined what we like and what we didn’t like about them. We wanted to create a system that incorporated all the advantages and eliminated all the drawbacks of the existing systems. Our solution really needed to be faster, easier, more accurate and more reliable,” Deichmann said.

At the opening day of IDS 2011, 3Shape launched its newest achievement, the TRIOS intraoral scanning solution, which aims to revolutionise the dental practice. The 3Shape booth was literally flooded with dentists trying to get a glimpse of the sleek and elegantly designed scanner.

One of the TRIOS 5-D scanner’s notable features is that it does not require dentists to apply spray or powder to coat the patient’s teeth, making scanning an easy, fast and comfortable process that does not ruin scan accuracy by adding material to teeth surfaces. In addition, it can scan any material, such as metals, semi-transparent materials and skin. It only requires minimal training for use in clinical practice. The scanner captures over 5,000 2-D images per second, which is 100 times faster than a conventional video camera. Dentists who viewed the presentations at IDS stated that an “impression-free” dental practice seems to be just around the corner.

An open communication interface allows dentists to send the scanned data via the Internet directly to the laboratory of their choice, where the technician can start designing the restoration immediately using 3Shape Dental System software or the appropriate interface to third-party software. The TRIOS communication software includes a tool to visualise the technician’s solutions for the patient, for example on an iPad, while the patient is still in the chair, which is especially important for anterior cases.

The system is designed to give dentists high-quality restorations and treat more patients rather than spending time and money on chairside milling. It handles a wide range of indications and produces quality 3-D data that can easily be realised by any laboratory.

Generally, digital data is controllable, predictable and available any time, requiring only minimal space. This guarantees that the dentist owns and is able to use patient data without limitation and can potentially export virtual set-ups to other systems, such as for appliance manufacturing.

Surprisingly, 3Shape is the only major dental company that offers easily integrable solutions. All products are designed as plug-and-play solutions and feature open interfaces for connection to third-party applications.

General Dempsey, the TRIOS project team pointed out.

Eat (and drink) your way to a whiter smile

Stars like Jessica Alba and Scarlett Johansson need killer for us mere mortals, a whiter, for our appearance and self-reveal that one of the first things that people notice about others is their smile, and as that old saw goes, you only get one chance to make a first impression.

Dr. Timothy Chase, a 15-year veteran of cosmetic dentistry in New York City says white teeth and healthy gums can take 10 years off your appearance. And while professional dental products work best for whitening, what you eat and don’t eat can play a huge role in how white your teeth are. It seems certain fruits, vegetables and other foods can aid in your quest for whiter teeth. Here’s what you should know about the white smile diet.

The crunch factor

Apples, cauliflower, celery and carrots work to whiten because they function as an abrasive scrub for teeth. These foods are nature’s toothbrush. They also stimulate the production of saliva, which helps keep plaque from forming. Stain sticks to plaque.

Orange ya glad?

The acid in oranges and pineapples may whiten and brighten the surface of the teeth. The acid also contains enzymes that kill bacteria that cause tooth decay and bad breath. ‘Saliva is the body’s wonder fluid,’ says Dr. Chase, and eating juicy citrus increases saliva production that washes away foods that stain like coffee, soda and red wine.

Strawberry patch

Strawberries contain an enzyme called malic acid that can whiten teeth. Munch berries several times a week to naturally whiten chompers.

Pass the cheese, please

Dairy products such as yogurt, milk and hard cheeses like cheddar contain lactic acid, which may help protect teeth against decay. Researchers think proteins in yogurt may bind to teeth and prevent them from attack by harmful acids that cause cavities. Dairy is also loaded with calcium, which guards and strengthens bone that holds teeth in place. Plus, chewing hard cheese creates saliva that protects your teeth against decay. Dairy is also high in protein, which is necessary to build and repair the enamel on your teeth.

The crunch factor

Carrots work to whiten because they contain a chemical called beta-carotene, which can be converted into vitamin A. Vitamin A helps keep your gums healthy. Healthy gum can take 10 years off your appearance.

3Shape has won Ernst & Young’s Entrepreneur of the Year in the Innovation category in Denmark three times. This prestigious award recognises innovation, leadership, state-of-the-art products, an international network and a clear strategy to pursue continuous growth.

Today, 3Shape’s development team consists of more than 100 developers of 22 different nationalities, with at least 50 PhDs amongst them. All their products and solutions are born from the union of cutting-edge technology with the latest trends in the industry and the market. 3Shape product managers and key developers have regular meetings with distribution partners around the world to keep each product at the top of its class. During the life cycle, the products are developed in close collaboration with partners who understand and continue to gather the needs of their customer base and the market.

But even with ten years of outstanding history, 3Shape never stops looking ahead. The company believes that the age of fully digital dentistry is only a few years down the road (of course there will always be smaller, traditional dental practices).
Lollipops May Reduce Tooth Decay

A recent study, published by the European Academy of Pediatric Dentistry, demonstrated that sugar-free lollipops containing licorice root extract significantly reduced the bacteria that causes tooth decay, specifically in pre-school children with high-risk of tooth decay.

The study, funded by the Research and Data Institute of the affiliated companies of Delta Dental of Michigan, Ohio, Indiana, Tennessee, Kentucky, New Mexico and North Carolina, analyzed 66 preschool students ages 2 to 5 enrolled in the Greater Lansing Area Head Start Program. Each student received a lollipop for 10 minutes twice daily for three weeks.

“Dental decay is one of the most common childhood diseases with more than half of children ages 5 to 17 having had at least one cavity or filling,” said Jed J. Jacobson, D.D.S., M.S., M.P.H., chief science officer at Delta Dental. “We are working to find simple, effective regimens that will encourage prevention and control of dental disease. While the results of this pilot clinical trial are encouraging, more research is needed to confirm these early findings.”

Results showed a significant reduction in Streptococcus mutans (S. mutans), the primary bacteria responsible for tooth decay, during the three-week period when the lollipops were being used and lasting for an additional 22 days before beginning to rebound.

Using a saliva test, the amount of S. mutans in the patient’s mouth was measured before and during the three-week period where lollipops were used, as well as for several weeks thereafter.

“The use of the licorice root lollipops is an ideal approach as it will stop the transfer and implantation of the bacteria that cause dental decay from mothers to their infants and toddlers,” said Martin Curzon, editor-in-chief, European Academy of Pediatric Dentistry. “It also has the merit of being a low cost-high impact public dental health measure.”

The lollipops, manufactured by Dr. John’s Candies of Grand Rapids, Mich., were developed using FDA-approved materials by Dr. Wenyuan Shi, a microbiologist at the University of California Los Angeles (UCLA), and C3 Jian, Inc., a research and development company in California. The orange-flavored, sugarless lollipops contain extract of licorice root (Glycyrrhiza uralensis), which targets and is thought to kill the primary bacteria (Streptococcus mutans or S. mutans) responsible for tooth decay.

VITA Easyshade Advance – To err was human!

More precise than the eye: digital determination and verification of all tooth shades

VITA Easyshade Advance features cutting-edge spectrophotometric shade measurement technology with an integrated light source. As a result, it is entirely independent of ambient conditions and delivers shade results in VITA SYSTEM 3D-MASTER, VITA classical A1-D4 and VITABLOC shades in a matter of seconds. Increase your reliability and profitability – very easily and entirely digitally with Easyshade Advance. / www.vita-zahnfabrik.com
Assurance

Invest in reliability. Focus on the patient. Express your style. From the people who build the most dependable dental equipment in the world, A-dec 200™ provides you with a complete system to secure a successful future.
