“No Anaesthesia” endodontics in children

By Dr Imneet Madan, UAE

“Laser Popping Sound” in dentistry for children is one of the best approaches that can help us to overcome the initial fear of the unknown when it comes to first treatment appointments in children. Its uniqueness lies in the fact that the need for numbing is completely exempted. Today’s children like technology playing at its best. Lasers definitely meet that perception of technology.

The initial visit appointments are usually not a concern as children do not anticipate any intervention. Since they are not in pain, their mindset of approach is not defensive. Rather when there is no pre-biased opinion or fear, there is a pleasant sense of adaptation that allows the smooth flow of the appointment. Any different kind of behavioural exhibit occurs only when kids are anticipating an intervention, when they had been in pain or when in general they come fatigued.

The discussion of needles is considered to be the most common subject just prior to the visit to the dentist. This discussion can become even more intense when there is already a perceived treatment need. Very young children can have the fear of the unknown, anxiety with strange and new places.

The older ones develop extreme fear by talking to peers who have been to the dentist before. Some of them might have had good and some others not so good experience. Sometimes, past unpleasant parental experience can distort the child’s adaptability to the dental appointment. They enter the clinic with the pre-formed image of the dentist which is not very convincing and helpful to the child. These external experiences can lay the foundation of the child’s coping ability in the dental chair.

How can lasers help?

Since laser is not commonly available at all practices, there could be a possibility that there had been no real discussion on the use of lasers in the treatment. Another possibility of having a good experience with lasers can change the perception of the child who is in for the first time.

When laser is introduced to the parents, they are informed about details on the functioning of laser and its benefits. While explaining euphemisms to the child, the laser is shown as “Popping Light”. There is a significant number of children who go awe-inspired to come back and get their teeth fixed.

The whole mindset of the child changes when they are told that treatments do not involve any needles approach.

“No Anaesthesia” Procedures that can be done without anaesthesia are:

– Restorations: Decays involving occlusal, labial, palatal, buccal or proximal surfaces of the teeth.
– Deep restorations on teeth with decays close to the pulp.
– Pulpotomies in primary teeth.
– Pulpectomies in primary teeth.
– Pulpectomies in primary teeth with abscess, fistula or swellings.

The term “No Anaesthesia” is a misnomer as the procedure is accom-
Endo Non-surgical and Surgical Retreatment (Management of Endodontic Failure)
Dr. Antonis Chaniotis, Greece

**PRICE**: 4,400 AED (1198 USD)

**TIME & LOCATION**: Thursday - Friday, 05 - 06 July 2018
CAPP Training Institute, Dubai, UAE

**CONTACT**: Email: events@cappmea.com
Mob: +971 50 2793717

**COURSE OUTLINE**:
**DAY 1** - To understand the rational behind non-surgical retreatment approaches and the etiology of non-surgical retreatment failures. To present an evidence-based framework for the safe and effective disassembly of obturation and obturation materials.

**DAY 2** - To understand the factors related to the long-term outcome of non-surgical endodontic retreatment and to develop a rational diagnostic and decision-making framework. To appreciate the importance of magnification and illumination for the management of complicated non-surgical retreatment cases.

---

Endo Micro Surgical Retreatment (Management of Endodontic Failure)
Prof. James Prichard, UK

**PRICE**: 4,400 AED (1198 USD)

**TIME & LOCATION**: Saturday - Sunday, 07 - 08 July 2018
CAPP Training Institute, Dubai, UAE

**CONTACT**: Email: events@cappmea.com
Mob: +971 50 2793717

**COURSE AIMS**:
**DAY 1** - To understand the rational behind micro-surgical retreatment approaches and acquire basic surgical knowledge.

**DAY 2** - To understand the importance of magnification in endodontic microsurgery and acquire basic micro-surgical skills.

---

Deep caries are excavated with pre-adjusted rapid prep settings: MX7, 3.75 W, 50 Hz, air 60, water 30. Following this step, the tooth is isolated and restored with composite (Figs 1 & 2).

**Pulpotomy procedure with erbium laser**
When the carious decay is found deep and in close proximity to pulp, exposure of the pulp can happen while removing this decay. In such situations, exposed pulp needs to be treated by removing the affected coronal pulp contents. This procedure is referred to as pulpotomy.

Deep caries are excavated with pre-adjusted rapid prep settings: MX7, 3.25 W, 25 Hz, air, water. There are two commercial settings that can be followed for the most acceptable cavity preparations:

- Comfort Prep: MX7, 3.75 W, 25 Hz, air 60, water 30
- Rapid Prep: MX7, 5 W, 20 Hz, air 80, water 50

Deep caries are excavated with pre-adjusted rapid prep settings: MX7, 3.75 W, 25 Hz, air, water 30 are used as we approach deep into the dentinal caries. As soon as there is pin point pulp exposure, few drops of Lignospan are dropped inside the coronal pulp chamber. This step is followed by opening partial access into the coronal pulp chamber. As we further deep into the coronal chamber, more anaesthetic intrapulpal infiltration is used followed by complete laser access opening.

After removing the coronal pulp contents, the chamber is irrigated and dried followed by diode laser sterilisation and coronal pulp filling with zinc oxide eugenol. The tooth is then filled with base Fuji IX and final restoration is done with composite or stainless steel crown.

**Pulpotomy procedure with erbium laser**
Teeth that have chronic profound caries, active signs and symptoms, and radiographical signs of pulp involvement, are indicated for pulpotomy. Pulpotomy involves the removal of both coronal and radicular pulp contents.

When the tooth is indicated for pulpotomy or root canal procedure, deep caries are excavated with pre-adjusted rapid prep settings: MX7, 5 W, 20 Hz, air 80, water 50, and then comfort prep settings: MX7, 3.75 W, 25 Hz, air 60, water 30 are used as we approach deep into the dentinal caries. As soon as there is pin point pulp exposure, few drops of Lignospan are dropped inside the coronal pulp chamber. This step is followed by opening partial access into the coronal pulp chamber.

As we go further deep into the coronal chamber, more anaesthetic intrapulpal infiltration is used followed by complete laser access opening. Once access has been done with laser, coronal pulp contents are removed. Before gaining access into radicular pulp chamber, few more drops of anaesthesia are dropped. Complete extirpation of radicular pulp contents is done with rotary instruments. Continuous copious irrigation is done with saline and chlorhexidine. Canal measurement is done and is a final step before obturation, both the erbium and diode laser are used for sterilisation. Final step is zinc oxide eugenol obturation, Fuji IX base filling and composite restoration.

**Pulpectomy procedure in primary tooth with abscess or fistula**
In cases where there are long-standing infections or chronic irreversible pulpsitis, it becomes inevitable to use both diode and erbium laser sterilisation after the laser assisted access and further steps as described above.

Until the point that canals are found completely dry, obturation is deferred. Usually it takes one or two visits to complete the final step of obturation in teeth with abscess or fistula. The entire treatment is completed with intrapulpal drops of anaesthesia when required. No infiltrations or blocks are used in the entire procedure.

This procedure has been practiced as an alternate to pre times extraction of primary teeth that has to be then replaced with a space maintainer. Most of the parents prefer this approach when compared to extraction, as they do understand that keeping the natural tooth as the space maintainer is indeed the best approach.

**Benefits of “No Anaesthesia” dentistry**
No risk of children having traumatic bite after the procedure is completed. The times when anaesthesia in children was a common practice, it was imperative to let the child and parents know about the numbing effect that would stay for few hours after the procedure. Cotton roll is given to bite on so that it serves as a reminder for the child.

Despite all these precautions, children may still land up in biting there lip or cheek. Once there is a traumatic bite, there is nothing much that can be done as the traumatized tissue has to self heal. This can be quite painful for the child, thereby defeating the entire purpose of pain free dental approach.

- Multi-quadrant dentistry can be practiced on the same day, same appointment.
- There is actual saving of chairside time, as there is no waiting period for local anaesthesia to work.
- Children can eat a few minutes after the procedure, which is not the case with local anaesthesia.

**Conclusion**
Practicing contemporary dentistry in children with the appropriate usage of technology and the key tools, is the way forward. The benefits of the “No Anaesthesia” erbium approach far outweighs the existing alternatives. This kind of professional approach can certainly become the gold standard for dentistry in chilen in the very near future.
Now, everyone in your dental team can **SHOOT!**

Ultra-Light
**SIMPLE** Compact
**Accurate**
Intuitive

**SHOFU** Smart Digital **EyeSpecial C-II**
- The only one true dental camera
- 8 automated pre-set dental modes
- Intuitive one-touch operation with built-in anti-shake

Root canal therapy and coronectomy

By Drs Mima Hobelka, Ali Hajj Hasan, Edgard Jabbour & Philippe Sleiman, Lebanon

Coronectomy is a procedure that generally spares the vital coronal pulp and is performed to avoid the risk of damaging the inferior alveolar nerve (IAN) during the surgical procedure when extraction of mandibular third molars is indicated or needed. Coronectomy is the removal of the crown of the mandibular third molar without exposing the pulp. The coronectomy procedure is performed only on the third molar crown, leaving the roots in the socket. This procedure is now known for its benefits and success rate, in contrast to the contemporary belief that the roots left behind will be a source of problems. Risk factors for nerve injury include root proximity, the surgeon’s experience, surgical procedures, the patient’s age and pre-existing disease. Several studies have shown that coronectomy significantly decreases the risk of iatrogenic injury to the IAN and lowers the complication rate.1 Coronectomy has been associated with a low incidence of complications in terms of IAN injury (0.0–0.9 %), lingual nerve injury (0.0–0.3 %) and pulp disease (0.3–1 %) in addition to other rare events, such as swelling, fever, abscess, pulps, pulps and root exposure.1

Coronectomy to prevent IAN damage was first proposed by Ecuyer and Debrin in 1984 and it remained controversial owing to the possibility of infection and other pathologies arising from the roots left behind.2 Potential complications include deep dry sockets, local postoperative infections, postoperative pain, pulps, root canal necrosis and infection, and an increased risk of IAN infection, which is known as failed IAN1 therapy. The point of discussion is whether it is necessary to perform root canal therapy simultaneously with coronectomy if the pulp is going to be exposed during the surgical procedure. A new method combining coronectomy with root canal therapy, when necessary, in order to decrease the risk of infection, pain and other complications is introduced in this paper.

Case presentation

A female patient in her mid-twenties was suffering from typical partially erupted third molar complications. A preoperative radiograph was taken (Fig. 3). The cross section revealed an intimate relation between the mesial root and the nerve, and thus indicated that any surgery at this point could cause some trauma to the nerve. The situation was explained to the patient, who was very concerned about the potential injury to the IAN. However, the patient presented with acute pain, which would require treatment, possibly antibiotic therapy, which in the future would be her go-to in case of a flare-up. This was definitely not an ideal solution, especially in view of the efforts currently being undertaken by the European Society of Endodontology to limit antibiotic prescription for root canal therapy to a reasonable and evidence-based minimum. The alternative solution in such cases is coronectomy.

Endodontic treatment was performed using the TF Adaptive SM (small/medium) procedure pack (Kerr) for root canal shaping. During the treatment, one periradicular radiograph was taken (Fig. 4) and it showed the curve on the mesial root. Irrigation was performed very safely with the EndoVac unit (Kerr), as any extraction of sodium hypochlorite could have severe consequences for the nerve and the apical area. The root canal therapy was completed in a single visit (Fig. 5), following which the surgeon performed the coronectomy. A bitewing radiograph was taken to check the level of the conical part after the excision and confirm that it was completely under the bone level (Fig. 6). A reinforced glass ionomer was used to seal the roots, and sutures were placed and left for one week. A small field of view CBCT was taken to check the postoperative outcome of the procedure (Fig. 7).

Two years after the treatment, the patient returned to the clinic complaining of some pressure sensations in the area. A CBCT was allowed to us to investigate the situation, and it revealed a pleasant surprise: the tooth had migrated coronally and gone above the nerve (Figs. 8 & 9). We explained to the patient that the remaining part of the tooth had moved towards the gingival level, which was why she was feeling pressure, and now it would be safe to remove the remaining tooth. The surgeon performed the intervention. Figure 10 shows how much the tooth had migrated over the two years and demonstrates the absence of any infection under the roots.

When an idea turns into innovation

By Marc Chalupsky, DTI

Although the headquarters of COLTENE are in Switzerland, its endodontics plant is in southern Germany. At the factory, located in Langenau, a town between Stuttgart and Munich, 155 employees produce treatment auxiliaries and endodontic equipment in a fully automated and camera- and laser-controlled process. The German location houses an impressive logistics department thanks to the office’s central location. Dental Tribune was invited to learn more about the company’s endodontic products.

A now well-known expert in endodontics, Dr Barbara Müller has been responsible for the company’s endodontics business unit for over 20 years. She takes pride in the company’s achievements. Today, COLTENE is an international leader in the development and manufacture of dental consumables and solutions for a variety of applications. The company operates worldwide, with subsidiaries and distributors in over 120 countries. With the 1990 introduction of the ParaPost X System, COLTENE came to be known as a provider of endodontic solutions. This position has been further entrenched in recent years as the company’s portfolio of endodontic products has continued to grow.

An impressive endodontic range

The CanalPro line, for example, features a cordless endodontic motor, a fully automated electronic apex locator and a variety of rinsing solutions, which are colour-coded for procedural safety. ROEKO and HYGENIC paper points are sterile and highly absorbent, and being non-adhesive, allow for reliable and easy drying of the root canal. Fast and safe obturation can be conducted with GuttaFlow bioseal, a bioactive three-in-one obturation material that combines cold free-flow gutta-percha with a sealer and bioceramic in one outstanding filling system and with HYGENIC and ROEKO Gutta-percha points. Recent studies have evaluated the in vitro toxicity of endodontic sealers such as GuttaFlow bioseal and GuttaFlow 2, as well as Angelus’s MTA-FILLAPEX and Dent...
Root canal treatments with the Endo-System by VDW – Peace of mind included

By VDW

MUNICH, Germany: Deliver root canal treatments with an opti-mally integrated concept from a single source. This claim is be-hind the campaign ‘Peace of mind included – the Endo-System by VDW.

Peace of mind included with the Endo-system by VDW means that dentists have a holistic system for simplified, individualised work pro-cesses. They also benefit from safety and efficient manufacturing using a special thermo-mechanical process whereby the crystallographic phase tran-sition from austenite to martensite at room temperature results in an advanced controlled memory of the material, making both files extremely-ly flexible. “We successfully man-aged to give our NiTi material shape memory properties,” said Müller. “We did this by changing the DNA of the material through a switch from low to room temperature. Our idea became not only an innovation, but a product many of our competitors have tried unsuccessfully to copy.” Introduced at the International Dental Show in Germany two years ago, the new HyFlex EDM reduces the number of files needed to two to three, particularly in straight and larger canals.

Proven clinical experience

According to Müller, a number of clinical studies have demonstrated the efficacy of both systems. For example, Goo et al compared the bending stiffness, cyclic fatigue and torsional fracture resistance of NiTi rotary instruments, including HyFlex EDM OneFile from COLTENE, Pro-Taper Gold and ProTaper Universal (both Dentsply Sirona). The results showed that HyFlex EDM OneFile demonstrated significantly higher cyclic fatigue resistance and higher distortion angle to fracture, but a lower torsional resistance than both ProTaper options. In addition, Pechula et al sought to measure the torsional and cyclic fatigue re-sistance of HyFlex EDM OneFile in comparison with VDW’s RECIROC R4s and Dentsply Sirona’s WaveOne Primary. HyFlex was found to have a significantly higher cyclic fatigue re-sistance and higher angular rotation to fracture. Furthermore, Lacono et al aimed to measure the wear of HyFlex EDM af-ter clinical application. No fractures were registered, no wear or degra-dation was reported, and the increased fatigue resistance of HyFlex EDM (compared with HyFlex CM) allowed it to remain usable for longer when shaping severely curved canals.

A case from the Philippines

Dr Margaret Tiu, a clinician based in the Philippines, agrees that the in-creased fatigue resistance and strong flex-ibility of both HyFlex systems allowed her to manage an S-shaped case more easily. As a recent COLTENIE Train the Trainer event, she presented a mandibular first mo- riar case with four canals that was referred to her by another dentist who could not negotiate the canal owing to its difficult anatomy. After utilising the crown-down technique and the HyFlex EDM files to flare the coronal third of the distobuccal and distolingual canals, Tiu then contin-ued to use HyFlex EDM to negotiate the mesiobuccal and mesiolingual canals, as she had discovered a slight curvature in the middle third of the canals. As for the 5-shaped disto-buccal and distolingual canal, she continued with the HyFlex CM files. Post obturation radiographs showed properly shaped canals with proper healing.

References

Endodontics in four steps

The key drivers to success with VDW are products and services linked through all treatment steps.

1. Preparation

File systems such as RECIROC® blue combined with VDW drives can be used to prepare the root canal with only one instrument.

2. Irrigation

The sonic-powered EDID® irrigation tip cleans even complex root canal anatomies safely and efficiently.

3. Obturation

GUTTAFLOW® can be used for homogenous, wall-adapted obtu-ration of the root canal.

4. Post-Endo

ITT Post-quantities posts with doub-ble taper design contribute to pre-paring more dentine during post-endo-dontic treatment.

Education and services for treatment success

The Endo-System by VDW is backed up by almost 150 years of experi-ence in endodontics. Dentists can take advantage of this expertise with the VDW education programme. Comprehensive service and consult-ing offers help to set up the optimal Endo-System and integrate it into the practice routine – with peace of mind included.

About VDW

VDW GmbH based in Munich, Ger-many is one of the most well known manufacturers working in the den-tal field of endodontics. For almost 150 years, VDW has been a pioneer in shaping the evolution of root canal treatment significantly. VDW focuses on offering the dentist a holistic solution covering the entire en-do-dontic treatment process including preparation, irrigation, obturation and post-endodontic care as well as service and training.
Membership in mCME Program

- 20 CME credit hours per year
- Quick and easy way to meet your needs
- Flexibility to work at your own place

- mCME participants are required to read the Continuing Medical Education (CME) articles published in each issue
- Each article offers 2 CME Credit and is followed by a questionnaire online
- Participants will receive the summary report with Certificate
